Acknowledgments

This report was planned and prepared in the Population Division under the primary direction of Nampeo D. R. McKenney, Chief, Ethnic and Racial Statistics Staffs; it was coordinated by Dwight L. Johnson with the assistance of Gloria J. Porter, Racial Statistics Staff. Major professional responsibilities also were shared by Virginia H. Williams and Patricia A. Johnson. Statistical assistance was provided by June Cowles and Julia Carroll.

Professional and editorial assistance was provided by Karen M. Mills of Population Division. Many persons within Population Division made contributions to the preparation of this report, in particular, Karen A. Crook, Maurice Moore, Martin O'Connell, Nancy L. Sweet, and Olga V. Fonville. The assistance of Tecora B. Jimason, Angela M. Britt, Annise L. Chapmon, and other members of the Racial Statistics Staff in the clerical operations is greatly appreciated.

Diana Harley, with the assistance of several other staff members of the Statistical Methods Division, conducted the sampling review of the report.

Many individuals within the Publications Services Division and Vivian J. Brown of Population Division made significant contributions in the areas of publication planning and design, editorial review, composition, and printing procurement.

We wish to express our special gratitude to Harvey Hamel and Barbara Job of the Bureau of Labor Statistics who made contributions to the chapter on labor force. Also, we are grateful to the personnel of the National Center for Health Statistics (Department of Health, Education, and Welfare), Defense Department, Joint Center for Political Studies, and other organizations who willingly provided data and their expertise in the preparation of this report.

NOTE

The term "Black and other races" describes persons of all races other than White and generally is used whenever data for Blacks alone are not available over the period of time shown. Statistics for the national population of Black and other races usually reflect the condition of the Black population, since about 90 percent of the population of Black and other races is Black.

In the past the Census Bureau has designated a head of household to serve as the central reference person for the collection and tabulation of data for each member of the household (or family). However, the trend toward recognition of equal status and roles for adult family members makes the term "head" less relevant in the analysis of household and family data. As a result, the Bureau is currently developing new techniques for the enumeration and presentation of data which will eliminate the concept "head." Although the data in this report are based on the concept "head," methodology for future Census Bureau reports will reflect a gradual movement away from this traditional practice.

Introduction

This report presents an historical view of changes in the demographic, social, and economic characteristics of the Black population in the United States. The historical profile is the distinguishing feature of this report, which is the ninth in the series on Black Americans. The study focuses on changes which have occurred in population distribution, income levels, labor force, employment, education, family composition, mortality, fertility, housing, voting, public officeholding, Armed Forces personnel, and other major aspects of life.

Most of the data presented in this report are from the Bureau of the Census with the decennial censuses and Current Population Surveys as the primary sources. In addition, statistics are presented from other Federal agencies and from private sources. The study assembles in one report data which have been published previously in many different volumes; in order to achieve historical comparability, some of the census statistics have been adjusted from those previously published. Still other data from the Census Bureau and other Federal and private agencies were specially tabulated or prepared for inclusion in this report.

The report is divided into two parts: Part One features historical trends covering the period from 1790 to 1975; Part Two covers recent trends from 1975 to 1978.

Each of the eight chapters in Part One contains a descriptive discussion of the major changes relating to a particular aspect of life for the Black population. The key years selected for data presentation in Part One, which covers a 185-year span, were 1790, 1870, 1890, 1910, 1940, 1960, 1970, and 1975. However, consistency in the years shown was difficult to achieve because of the unavailability of the data. Statistics for some subjects, such as income, have become available only within the past three to four decades and, therefore, are shown for different years and for a much shorter time period. In general, the earliest available data for each topic are included in the chapters.

The most current information available has been presented in Part Two of the report.

A view of the characteristics of the Black population in the 18th and 19th centuries is provided by census statistics supplemented by historical accounts. These data sources reveal that during most of the 1700's and 1800's, the prevalence of slavery was a major influence on the historical development of Black Americans. In the first census of 1790, about 757,000 persons were reported as Black. Seventy years later, just prior to the Emancipation Proclamation, the 1860 census showed the Black population had grown almost sixfold to 4.4 million. This large increase was due to the importation of slaves and high fertility levels. In each census

during the pre-Civil War period, 86 percent or more of the Blacks were slaves. In addition, both the 1790 and 1860 censuses showed that 9 of every 10 Blacks lived in the South.

The last 30 years of the 19th century (the Reconstruction Period) brought unprecedented numbers of Blacks into public office in both the U.S. Congress and State governments of the South. Following the Civil War, the growth rate of the Black population turned downward.

In 1890, census results indicated that most Blacks lived in rural areas and continued to live in the South. Moreover, illiteracy was widespread, as only a small number 61 Blacks received formal educational training. At this time, the majority of Black men were agricultural workers, while Black women were employed primarily in domestic and personal service occupations.

Modest improvements in the living conditions of Black Americans began to take place during the latter part of the 19th century and continued into the 20th century, when profound changes occurred. Developments and events such as the transformation of the Nation from an agricultural to an industrialized one, the Depression, the World Wars, the Korean and Vietnam wars, Federal government programs, the migration of Blacks from the South to the North, civil rights movements, and voter-education programs have all had an impact upon the socioeconomic status of Black Americans in the 20th century.

In the early decades of the 20th century, the overwhelming majority of Blacks continued to live in the South, although relatively large numbers (a net outmigration of 749,000) left the South during the 1920's. During the early part of this century, the growth rate for the Black population showed a general downward movement, with only a few interruptions, as a result of general declines in fertility levels.

Progress was made in education, health, and employment in the beginning decades of the 20th century. Illiteracy was reduced substantially as a consequence of increased availability of schooling; between 1890 and 1910, the illiteracy rate dropped from 61 to 33 percent. Health conditions improved and important gains were made in life expectancy for Blacks, especially in the decade between 1909-11 and 1919-21 when life expectancy at birth increased 13 years for Black males and over 9 years for Black females.

The 1930 census showed that 5.5 million Blacks were in the labor force. The labor force had experienced some growth since the 1890 census, primarily as a result of a national population increase and the expansion of unskilled jobs during and immediately after World War I. The occupational distribution for Blacks from the 1930 census reflected

substantial declines in agricultural employment and the movement of Blacks out of the Southern agricultural areas to unskilled factory jobs in the North. In 1930, however, 37 percent of Blacks were still working in farming and related occupations.

In contrast to the gains mentioned above, for the first three decades of this century, the advances made in political representation during the Reconstruction Period were almost obliterated.

The Great Depression substantially diminished some of the gains made in the first three decades of the 20th century. For example, during the 1930's, the growth of the Black labor force was severely curtailed.

The 1940's marked the beginning of the predominantly one-way migration stream of Blacks from the South to the North; this movement continued to the 1970 decade. (The South lost close to 1.5 million Blacks in each of the three decades.) One of the major factors contributing to this migration was that World War II accelerated the movement of Blacks from the South to job opportunities in the industrialized areas of the North. As a further consequence, the geographical distribution of the Black population changed; by 1970, only 53 percent of Blacks lived in the South and 81 percent lived in urban areas.

A large increase in average life expectancy at birth for Blacks was recorded during the World War II period: 7 years for both Black males and females. As the major diseases of the early 1900's—childhood and infectious diseases—were brought under control by an improved standard of living, expanded public health programs, etc., progress was made in reducing mortality levels among Blacks. Fertility levels for Black women began to increase again in the late 1940's and reached an apex in the 1950's.

Progress in educational attainment was most impressive for the Black population, especially for young Black adults. Most of the change has occurred since 1960. For instance, in 1940 (the first census in which information on years of school completed was collected) 1 out of 10 Blacks 25 to 34 years old had completed high school; two decades later, in 1960, the proportion was 3 out of 10; and only one decade later, in 1970, about 5 out of every 10 Blacks 25 to 34 years old were high school graduates.

Information on the composition of Black families, available only since 1940, indicates a trend of declining proportions of families with both a husband and a wife present and increasing proportions maintained by a woman. Specifically, in 1940, 77 percent of Black families had a husband and wife present; by 1970, the figure was reduced to 68 percent. Concomitant to the trend of declining proportions of families with a husband and wife present has been a decline in the proportion of own Black children living with both parents.

In 1940, Blacks were greatly concentrated in the lowest paying, least-skilled jobs; few had white-collar or craft positions. By 1970, advances had been made, with the proportion of Blacks in white-collar jobs quadrupling from 6 percent in 1940 to 24 percent in 1970.

The Census Bureau began collecting income information by race on a continuing basis in 1947. Since then, there has

been overall moderate income growth for Black families, interrupted by several recessions. From 1947 to 1969 (after accounting for inflation in terms of 1974 dollars), the most pronounced upgrading (36-percent increase) in the income levels for Blacks occurred during the period 1964 to 1969. Increases were noted during the 1947-53 and 1959-64 periods; however, little or no progress was made during the period from 1953 to 1959 as a result of the 1953-54 and 1957-58 recessions.

Unemployment rates for Blacks have fluctuated since 1948 (the first year these data were available by race from the Current Population Survey). The rates were lowest during the Korean war years (1951 to 1953). After the Korean war, rates began to rise and reached high levels between 1958 and 1963, reflecting the effects of the 1957-58 and 1960-61 recessions. Declines were recorded in the mid- and late 1960's, but by 1970, jobless rates had begun to creep upward again.

In examining the trends from 1940 to 1970, of particular note is the 1960 decade, especially the mid- and late 1960's, when Blacks made major social and economic advances in income, employment, education, voter registration and participation, home ownership, and election to public office, and the number of Blacks in poverty were reduced. It has been suggested that expanded government programs, the civil rights movements, and efforts to reduce segregation and discrimination were some of the factors which contributed to the progress.

Unlike the patterns noted for the 1960 decade, the 1970's (presented in both Part One and Part Two of this report) portray a mixed picture for Black Americans. Blacks continued their progress in the areas of education, home ownership, and election to public office. Nevertheless, the prolonged dual impact of the recessions and inflation continued to adversely affect income and employment. For instance, the 1977 median income for Black families (\$9,560) showed no improvement over the 1974 level; the number of Blacks in poverty in 1977 (7.7 million) rose by over one-half million from the 1974 level; and unemployment levels remained high despite slight improvement in mid-1978.

The 1970 decade has been further distinguished by changes in migration patterns, family composition, fertility levels, and the work experience patterns of family members. Undoubtedly, these factors and their interrelationships have had, and will have in the future, an imprint upon the demographic, social, and economic characteristics of the Black community.

In summary, significant advances have been made by Black Americans since the first census was taken in 1790. However, in 1978, the 25.4 million Blacks in this country remained far behind Whites in almost every social and economic area.

Detailed information on these and other measurable aspects of the living conditions of Blacks from 1790 to 1978 are presented in the 10 chapters of this report.

¹The difference in the rate of increase in income levels during the 1964-69 and the 1947-53 period is statistically significant at the 1.6 level of significance. See appendix C, "Source and Reliability of the Data."

FIGURE 2.

Resident Black Census Population and Corrected Estimates of the Population, for Selected Years: 1790 to 1975

I. Population: Growth, Distribution, and Composition

Growth

At the time of the first census in 1790, the Black population numbered about 757,000. A century later the Black population had grown nearly tenfold, to 7.5 million. By the mid-1970's, the number of Blacks in the United States was over 24 million, more than 30 times the number in 1790.

Limited information is available on the size of the Black population living in this country prior to the first census. In 1650, just a few years after the importation of Black slaves began, it is estimated that the colonies contained about 1,600 Blacks. Estimates of the Black population around the time of the birth of our Nation are 462,000 for 1770 and 562,000 for 1780.

The growth rate of the Black population has varied considerably since the first decennial census. The Black population grew at a rapid rate—in excess of 2.0 percent per year—between the first census and the 1860 census, the census preceding the Civil War. The sustained growth can be attributed to two factors—the continued importation of slaves and the natural increase (excess of births over deaths) of the resident population (table 1). The importation of slaves into the United States was forbidden by law after January 1, 1808, but illicit slave traffic continued until the Civil War.²

Following the Civil War, the growth rate of the Black population experienced a downward trend as a result of the complete cessation of the slave trade and declines in fertility. This trend appears to have continued, with only a few interruptions, through the depression years 1930 to 1940 (tables 1 and 2).

A pattern of more rapid growth developed after World War II; the growth rates in the 1950-60 decade (the height of the post-war "baby boom") approached a level close to that of the pre-Civil War years. The average rate of growth in the 1970's showed a decline from the peak rate of the 1950's;

lowered fertility was the major factor contributing to this drop. ³

Blacks constituted a much larger proportion (19.3 percent) of the total population in the first census (1790) than in any succeeding census year. For the 140-year period extending from 1790 to 1930, the proportion of Blacks in the Nation declined, reflecting the more rapid growth rate of the White population which resulted from the waves of immigration from Europe. The proportion of Blacks began to rise after 1940 and reached 11.5 percent in 1975 (tables 1 and 2).

Slave Population—Growth and Distribution

The first census in 1790 showed that almost all (92 percent) Blacks were slaves. The proportion was only slightly lower (89 percent) in 1860, 5 years prior to the issuance of the Emancipation Proclamation. During the time span from 1790 to 1860, the proportion of Blacks who were slaves showed little variation, ranging from a low of 86 percent in 1810 and 1830 to a high of 92 percent in 1790.

The legal prohibition of the African slave trade in 1808 had little effect upon the growth of the slave population. As shown by the figures in table 3, the increase in the slave population was fairly stable during the 70-year period from 1790 to 1860, partly because slaves continued to be imported illegally into the Nation and rates of natural increase were high.

During the pre-Civil War period (1790 to 1860), the slave population was highly concentrated in the Southern States (over 90 percent lived there). In 1790, four States—Maryland, North Carolina, South Carolina, and Virginia (which included West Virginia)—contained most of the slave population. By 1850, the slave population had spread, and concentrations were also found in Alabama, Georgia, Kentucky, Mississippi, and Tennessee (table 4).

¹ U.S. Bureau of the Census, Department of Commerce and Labor, A Century of Population Growth in the United States: 1790-1900, Washington, D.C.: U.S. Government Printing Office, 1909, p. 8.

² According to the Encyclopedia of American History, Richard B. Morris, Editor, New York: Harper and Brothers, 1961, p. 544, "one estimate of the slaves brought into the U.S. illegally, 1808-60, places the total at 250.000."

³ Census Bureau studies have shown that there is net undercount of the population in the decennial censuses. Estimates of the Black population (and growth rate) corrected for net undercoverage have been developed for the census years 1900 to 1970 and are presented in table 2. The discussion on growth patterns since 1900 is based on these corrected estimates.

Migration

In 1970, most of the free Blacks and a small proportion of slaves resided in the North; however, until recent decades, the vast majority of Blacks continued to live in the South. The movement of large numbers of Blacks from the South to the North began during World War I and gained momentum after the war. During the 1920's, for example, the net outmigration of Blacks from the South was about 749,000; during the previous decade the figure was only about 450,000. In the 1930's, there was continued net outmigration from the South, but at a much diminished pace from the 1920's.

During the last three decades (1940 to 1970) Blacks left the South in very large numbers; the South lost close to 1.5 million Blacks in each of the three decades. This movement resulted in the profound changes in the distribution of the Black population, which are discussed in the next section. Analysts have provided a number of reasons for the exodus from the South, such as the pursuit of economic benefits in the North, which had become highly industrialized; a desire to elude racial discrimination, segregation, and injustice; and agricultural depression in some parts of the South. At first the North was the destination of most Blacks; however, substantial numbers later migrated to the West Coast, primarily to California, as reflected in the sharp rise in the proportion of Blacks in the West during the 1940-75 period (tables 5 and 8).

In the 1970's, a new pattern of migration appears to be emerging; the South has been experiencing a decline in the volume of Black outmigration and, at the same time, an increase in Black inmigration. In fact, during the 5-year period from 1970 to 1975, the number of Blacks 5 years old and over moving to the South closely approximated the number moving from the South—302,000 inmigrants versus 288,000 outmigrants (table 9).

Distribution

Each census from 1790 to 1910 indicated that about 9 out of every 10 Black Americans lived in the Southern region. After 1910, this proportion began to decline and its downward movement accelerated during the 1940-70 period, due to the predominately one-way migration stream from the South to the North (noted above). In 1940, 3 out of 4 Blacks were residents of the South; by 1970 only one-half (53 percent) were in the South. This downward trend, however, appears to have halted in the 1970's, and in 1975, the proportion of Blacks who lived in the South was about the same as the 1970 level (table 5).

As a consequence of Blacks moving out of the South, the proportion of Blacks in both the North and West have shown substantial increases over the years. The proportion of Blacks in the North was 39 percent in 1975, almost four times the percentage in 1910. The West, which had only 1 percent of the Blacks in 1910, contained about 9 percent in 1975.

Throughout the census history, the geographic residential distribution of the Black population has been less diversified than that for the White population (table 5).

In 1890 (the first census for which urban-rural data for Blacks were available), most Blacks (80 percent) resided in rural areas. Eighty years later, the situation had completely reversed; Blacks had become a highly urbanized population. Most of the urbanization occurred in the years after 1940, fed by the large influx of Blacks to northern cities from southern rural areas (table 6).

The most recent census indicated that Blacks were more urbanized than Whites. Of the Black population, 81 percent lived in urban areas in 1970 compared with 72 percent of Whites. Urban Blacks have concentrated in the central cities of the largest metropolitan areas and continue to comprise an increasing proportion of the population in these cities. The proportion of Blacks of the total central city population rose from 16 percent in 1960 to 23 percent in 1975, as a result of modest increases in the Black population and the exodus of Whites to the suburbs. The proportional increases of Blacks in the large metropolitan areas (1 million or more) were even greater during this period (tables 6 and 7).

The proportion of Blacks in the total suburban population (outside central cities of metropolitan areas) showed a slight decline from 1960 to 1970. Since 1970, there is some evidence that the proportion has risen slightly, as a result of a higher annual rate of growth among Blacks than among Whites in the suburbs (table 7).

Age and Sex Composition

The age distribution of the Black population has shown substantial change over the past 100 years. In 1870, the Black population was relatively young, as reflected in a median age of 18.5 years. Over the next seven decades (1870 to 1940), the median age increased by 6.6 years to 25.1 years. This marked increase in the median age of the Black population was primarily a result of declines in fertility over this period (table 10).

The median age in 1960 and 1970 implied a drop from the 1940 level—a drop which reflected the impact of increased fertility during the baby boom era. Between 1970 and 1975, this pattern reversed itself; the median age rose from 22.4 in 1970 to 23.4 years in 1975. The latter figure was almost identical to the 1960 figure.

The proportion of the Black population below the age of 15 has varied from census to census, also reflecting changes in fertility levels. The proportion declined from 38 to 30 percent between 1910 and 1940, then climbed to 37 percent in 1960, and by 1975, had dropped again to 32 percent (table 10).

Black persons 65 years old and over have constituted an increasing share of the total Black population since 1910. By 1975, 7 percent of the Black population, or double the corresponding proportion in 1910, was in this age group. The growth in the relative number in this age category has resulted primarily from declines in fertility.

An excess of females over males in the Black population has appeared consistently in the census returns for over 100 years. In the last census, there were over 1 million more females than males in the Black population. The sex ratio (the number of males per 100 females) of the Black

population during the last six censuses has varied from 98 to 91 (table 10). The preponderance of females over males may be overstated because of the relatively greater undercoverage of males than females in the decennial census. For example, the estimated 1970 sex ratio, corrected for undercoverage, is

95, compared with the figure of 91 shown by the decennial census returns.⁴

⁴ U.S. Bureau of the Census, Evaluation and Research Program of Estimates of Coverage of Population by Sex, Race, and Age: Demographic Analysis, PHC (E) - 4, 1973, p. 28.

X Not applicable.

NOTE: The 1930 census and subsequent decennial censuses were conducted as of April 1 of the respective year; prior to 1930, the month of enumeration varied.

In this section, the data for 1975 are from different sources. The 1975 data shown in tables 1, 10, 11, and 12 are estimates of the population; 1975 data shown in tables 5, 7, and 9 are from the Current Population Survey.

 $^{^{1}}$ Computed by the formula for continuous compounding, p ₁= p ₀ e

 $^{^2}$ Revised to include adjustment of 1,260,078 persons (512,163 Black and 747,915 White) for underenumeration in the Southern States. Unrevised census count is 38,558,371 for the total population and 4,880,009 for the Black population. Unadjusted data are used in subsequent tables because revised figures for States, age, etc., are not available.

II. Income

INCOME LEVELS AND SELECTED CHARACTERISTICS OF FAMILIES AND PERSONS

Income is a major yardstick of the economic life of the Black population. Income trends are gauged by various summary measures such as median income, mean income, income ratio, etc. In recent years, family income levels of the Black population have been increasingly affected by changes in family composition and work experience patterns of family members. Thus, an understanding of the changes in these variables (which are discussed in this chapter in addition to the "Family" chapter) is important in assessing differential income trends for Black and White families.

Income statistics as used here, refer to all money receipts received by families or persons during the preceding calendar year from a number of sources including wages and salaries, self-employment, public assistance, and Social Security (see "Definitions and Explanations" section). Most of the data shown in this chapter are for family income, i.e., combined receipts of all members of the family during the calendar year. With few exceptions, the income figures have been adjusted for inflation and are presented in terms of 1974 constant dollars.

Income data were first tabulated separately for the Black population in the March 1965 Current Population Survey (income in 1964). With the exception of data on Blacks from the 1960 decennial census, income data for the years 1947 to 1963 shown in this chapter are for Black and other races. For earlier years in this chapter (1935-36), data from Myrdal's An American Dilemma offer a limited view of income levels of Black families for selected cities (table 13).

Generally, statistics for the Nation as a whole for Black and other races reflect the condition of the Black population. In 1975, Blacks comprised about 90 percent of the population of Black and other races. The income levels for Black and other races tend to be higher than for Blacks separately; this differential is due primarily to the relatively higher incomes received by certain Asian groups which are included in the former category. Therefore, the ratio of median family income for Black and other races to White will tend to be higher than the ratio for Black to White. This disparity will be wider for certain areas of the country, such as the Western region, where there is a larger concentration of the Asian

population. For example, the 1970 census showed that in the West over 30 percent of the population of Black and other races was Asian, whereas in the Southern region, 99 percent of the population of Black and other races was Black.

In this chapter, the term "Black" is used throughout the text although the data may be for "Black and other races." In a few instances, distinctions are noted between income levels of Black and other races and Black because the two population groups show different income patterns or trends. (See the discussion on "Median income ratio," for example.)

Trends in Family Income: 1947 to 1974

Median income levels. For Black families, the 27-year span from 1947 to 1974 is characterized as an overall period of moderate economic growth, interrupted by several recessions. During this period (after accounting for the effects of inflation) the median income of Black families more than doubled, with the most pronounced upgrading in the income levels occurring from 1964 to 1969. In contrast, little or no progress was made during the 1953-59 and 1969-74 periods.

In 1947, the median income of Black families (in 1974 dollars) was \$3,560; by 1953 it had increased by 28 percent to \$4,550. The growth in income levels of Black families slowed from 1953 to 1959, as a result of the 1953-54 and 1957-58 recessions, but a moderate increase (20 percent) was again evident for the 1959-64 period (table 15).

Between 1964 and 1969, the median family income of Black families rose by about 36 percent, from \$5,920 to \$8,070. Conversely, during the more recent period (1969 to 1974), the income levels for Black families were adversely affected by the severe inflationary pressures and the 1969-70 and 1973-75 recessions. The 1974 median income of \$7,810 for Black families was about 3 percent below the 1969 level.

From 1947 to 1974, the median income of Black families increased proportionately more than that of White families—119 percent compared with 92 percent. However, considering the five periods shown in table 15, the proportionate

¹ The difference in the rate of increase in income levels during the 1964-69 period and the 1947-53 period is statistically significant at the 1.6 level of significance. See section, " Source and Reliability of the Data."

increase in the median income of Black families was less than that for White families during the 1953-59 period, and, as noted earlier, between 1969 and 1974 the median income of Black families experienced a decline (table 15).

The rising median incomes of Black families are reflected in the substantial changes in the proportion of these families located in different income intervals. The proportion of Black families with incomes under \$3,000 in terms of 1974 purchasing power declined from 43 percent in 1947 to 15 percent in 1974, which is a decrease of about two-thirds. Substantial declines in the proportion of families with incomes under \$3,000 were observed for each time interval shown in table 21 except for the intervals 1953 to 1959 and 1969 to 1974.

The increase in the proportion of families with incomes over \$10,000 was considerable. In 1947, only 8 percent of Black families had incomes of \$10,000 or more as compared with about 39 percent in 1974. For this income category, the period of greatest change occurred from 1964 to 1969. The progress made by Black families in attaining higher incomes did not continue during the subsequent 5 years (1969 to 1974). The proportion of Black families with incomes over \$10,000 in 1974—39 percent—was virtually the same as it was in 1969 (table 21).

One of the major reasons for the rise in Black family median income has been the increasing proportion of wives who work and thus contribute to the family income. For example, the median income (in current dollars) of Black husband-wife families with working wives increased from \$4,170 in 1959 to \$8,950 in 1969, an increase of 115 percent. At the same time, the median income of Black families in which the husband was the only earner increased from \$3,020 to \$5,570, or by 85 percent.²

Median income ratio. Although Black families experienced relatively greater increases in median income than White families from 1947 to 1974, the median income levels in 1974 of Black families were still substantially below those of White families. The median income of Black and other races families (\$8,270) in 1974 was only 62 percent of the median income of \$13,360 for White families (table 14). However, a small segment of Black families achieved income equality with their White counterparts during this period. (See the discussion on young husband-wife families.)

The median income ratio of Black and other races families to White families has varied during the 27 years (1947-74) largely as a result of expansions and downturns in the economy. These fluctuations appear to be related to the tightening of the labor market and business cycle expansions and contractions (table 14).³

In 1947, the median income ratio of Black and other races to White families was 51 percent; the ratio moved upward

² U.S. Department of Commerce, Bureau of the Census, Current Population Reports, Series P-23, No. 39, p. 7

³ Albert Wohlstetter and Sinclair Coleman, Race Differences in Income, (Santa Monica: The Rand Corporation), 1970 p. 27.

with some fluctuation during the 1947-53 period and registered 56 percent by 1953. After 1953, a general downward movement in the ratio was evident, but by 1964, the ratio had again advanced, returning to the 1953 level of 56 percent. The median income ratio increased from the 56 percent in 1964 to 63 percent in 1969, as a result of the substantial economic growth for families of Black and other races. By 1974, the income ratio was not significantly different from the 1969 level (table 14).

The ratio of Black to White median family income from 1964 to 1974 shows a slightly different pattern from that of Black and other races to White. Over the entire period, the ratio rose from 54 percent in 1964 to 58 percent in 1974. Since 1969, however, the overall income differential between Black and White families has widened—from 61 percent in 1969 to 58 percent in 1974. The "index of income overlap," another measure of income comparability, was about 72 in both 1969 and 1974, indicating that the differentials between Black and White income size distribution had remained much the same (tables 14 and 20).

The decline in the Black-to-White median family income ratio from 1969 to 1974 reflects many interrelated factors. Briefly, differential changes in the proportion of Black and White multiple-earner families and work experience patterns of family members appear to be among the more important factors. In turn, the variations in these two factors are largely the result of changes in (1) family composition, such as the proportion of families maintained by women, and (2) the proportion of husband-wife families with wives in the paid labor force. Historically, Black families have had a greater proportion of multiple earners than White families. Within recent years, however, there has been a decline in this proportion among Black families. In 1974, the proportion of Black families with multiple earners (48 percent) was less than that of White families (54 percent) (table 23). The number of earners and their relative importance in Black families and White families affect the size of the income gap between Blacks and Whites. Table 23 shows that the incomes of Black families with at least two earners were relatively closer to those of corresponding White families than were the incomes of Black families with only one earner.4

Other income measures. The increase in the number of families and total money income between 1947 and 1974 contributed to the growth in aggregate family income over the period. Aggregate income (unadjusted for inflation) of Black families rose from \$6 billion in 1947 to \$64 billion in 1974. During those years, the number of Black families increased by 3.1 million and the mean family income increased fivefold (tables 16, 17, and 18).

Although there has been an increase both in the number of Black families and in total aggregate income, Black

⁴ A detailed analysis of these and other factors is presented in Current Population Reports, Series P-23, No. 54, "The Social and Economic Status of the Black Population in the United States: 1974." (Also, see tables 22, 23, and 25 in this section.)

families continue to receive a disproportionately low share of the total money income in the United States. In 1974, Black families comprised 11 percent of all families in the United States and received 8 percent of the aggregate family income. Yet, these proportions represented some improvements over 1947 proportions, which were 8 and 5 percent, respectively (table 16).

Although in absolute terms the level of economic well-being of the Black community has improved during the past quarter-century, there has been little variation in the distribution of income within that community. The share of aggregate income received by each fifth and top 5 percent of Black families has remained relatively stable since 1947; the same was true of White families (tables 17 and 18).

Income Levels by Type of Family and Number of Earners

Income data on Black families by selected characteristics, which are generally available since 1964, show significant variations in income for the Black community. From 1964 to 1974, the median income of families maintained by Black men rose by 48 percent (in constant 1974 dollars), from \$7,020 to \$10,370, with most of the change occurring during the first 5 years of this period. Among the families maintained by men, the median income of families in which both the husband and wife were in the paid labor force rose more steeply than that for families in which the wife was not in the paid labor force (table 22).

The median income of families maintained by a woman was considerably less than that for families maintained by a man. In the decade from 1964 to 1974, the rise in incomes for families maintained by women was only about one-half as much as that for families maintained by men. In fact, the median income of families maintained by women showed virtually no change in the latter half of that decade (1969 to 1974). The lack of growth in income, coupled with the increasing proportion of Black families maintained by women, particularly since 1969, contributed to the decline in the overall median income level for Black families, noted previously in this chapter.

In the same 10-year period (1964 to 1974), the median income of Black families with two or more earners grew faster than that of Black families with one earner or no earners. Black families with multiple earners increased their median income level by 55 percent, from \$7,910 to \$12,280 (table 23).

Regional Trends in Family Income: 1953 to 1974

Income data by region first became available from the March 1954 Current Population Survey. In the South and in the North and West, Black families have experienced growth in real income; however, there has been greater improvement in the South. From 1953 to 1974, the median income (in constant dollars) of Black families in the South about doubled from \$3,350 to \$6,730. In the North and West, the

comparable figures were \$6,450 in 1953 and \$9,260 in 1974, an increase of 43 percent.

In 1964, the median income for Southern Black families (\$4,600) was about 57 percent of that for Black families in the North and West (\$8,010). Substantial improvement occurred in the 10-year period ending in 1974, when the median income for the 2.8 million Black families living in the South was about 73 percent of the income for Black families in the North and West (table 19).

Regional differences in real income growth over the 21year span (1953-74) are further reflected by the income distribution of Black families. In the North and West, the percent of Black families with incomes of \$10,000 and over more than doubled between 1953 and 1974; in the South, the percent for Black families increased sevenfold. The proportions for the North and West were 20 percent in 1953 and 46 percent in 1974; comparable proportions for the South were 4 and 31 percent, respectively. For the periods under consideration in table 21, for Black families, the largest percentage point increase in the \$10,000 or more income category for the North and West, as well as for the South, occurred from 1964 to 1969. In line with the gains noted at the upper end of the income distribution among Black families in the North and West and the South, there has been an accompanying decline at the lower end of the income scale (incomes under \$3,000) (table 21).

In 1974, the median income level of Black families remained below that of White families in the North and West and in the South. In the North and West, the median income ratio of Black to White families had declined since 1953 (75 percent in 1953 versus 67 percent in 1974). On the other hand, the corresponding median income ratio for families in the South improved somewhat—from 49 percent in 1953 to 56 percent in 1974 (table 19).

The income data on Black families shown by region for the earlier years (through 1959) presented in tables 19, 20, and 21 include families of "other" races. As noted previously, this has the particular effect of raising the income levels shown for Black families in the West and in the North and West.

Recent Changes in Young Husband-Wife Families

The overall Black-to-White median income ratio does not necessarily reflect the income positions of all segments of the Black community. At least one segment of the Black population-young husband-wife families (husband under 35 years) in which both the husband and wife were earners in the North and West-has made dramatic strides in its economic position relative to comparable Whites. In fact, by 1969 these young Black husband-wife families had actually achieved income parity with their White contemporaries; this relationship held through 1974 (table 26). (This situation was not true for Black families in which the husband was the only earner.) Although these gains were impressive, in the North and West these young Black husband-wife families in which both spouses were earners continued to comprise a very small proportion (6 percent) of all Black families in this country in 1974.

In the South, Black husband-wife families (husband under 35 years) have also made substantial improvement in their income position relative to corresponding White families. Data for the more recent period from 1969 to 1974 suggest that these young Black families in the South are approximating the earlier patterns of their contemporaries in the North and West. Between 1959 and 1969, the ratio of Black-to-White median income of Southern families in which both the husband and wife were earners advanced 16 percentage points, from 56 percent to 72 percent; in the 5-year period from 1969 to 1974, it increased another 12 percentage points to 84 percent (table 26).

Among young husband-wife families, regardless of region, the income gap between Blacks and Whites has been narrowed through the earnings of Black wives. In the South, young Black wives had mean earnings in 1974 which were almost equal to those of their White counterparts (\$3,790 and \$4,050, respectively); in contrast, the Black husbands in these families averaged 80 percent of the comparable White husbands' earnings. In 1974, the contributions of young Black wives to the family income was proportionately greater than those of young White wives. Between 1969 and 1974 in the South, the mean earnings of Black wives as a percent of family income increased from 29 to 33 percent, whereas the comparable proportions for White wives remained around 29 percent.

During the 1959-74 period, the mean earnings of young Black wives in the North and West kept parity with those of young White wives, whereas in 1974, young Black husbands in the North and West still had incomes lower than their White counterparts. However, during this period the mean earnings of young Black husbands as a percent of the mean earnings of young White husbands increased from 76 percent in 1959 to 93 percent in 1974 (table 28).

Income of Persons

By concentrating on the data for Black persons and White persons, it is possible to focus on changes which affect individuals rather than a group such as families, which is subject to changes in composition over time.

Over the past quarter of a century (1948 to 1974), the gains in income for Black men were somewhat less striking than those recorded for Black women. In addition, the gains in the income for Black women relative to White women were more pronounced than the gains realized by Black men relative to White men.

From 1948 to 1974, the median income of Black women rose by 178 percent, from \$1,010 to \$2,810 whereas the median income for Black men rose by 92 percent from \$2,790 to \$5,370. The corresponding increases for White women and White men were 35 and 71 percent, respectively. The median income ratio of Black women to White women showed substantial improvement from 43 percent in 1948 to 90 percent in 1974. On the other hand, the income ratio of Black men to White men increased only slightly over the 26 years, from 54 percent to 61 percent (table 30).

Considering the more recent period from 1969 to 1974, the ratio of Black-to-White median income increased for both Black men and women, in contrast to the changes in income experienced by Black families. In 1969, the Black-to-White median income ratio for men was 58 percent; by 1974, the ratio had moved upward slightly to 61 percent. The income ratios of Black-to-White women were 84 percent and 90 percent, respectively, in 1969 and 1974 (table 30).

The striking increase from 1947 to 1974 in the ratio of Black to White median income for women is largely the result of increased earnings of Black women. For example, among women with wage and salary income (unadjusted for inflation), the income of Black women increased elevenfold between 1947 and 1974 compared to a fourfold increase for the comparable group of White women (table 32).

Year-round full-time workers have higher incomes, on the average, than do other workers. Black men who worked year round full time have incomes which are closer to their White counterparts than all Black men (regardless of work experience). Black men with year-round full-time jobs had a median income of \$8,710 in 1974, or 70 percent of the median income for comparable White men. The corresponding ratio for all Black men was 61 percent. In contrast to Black men, the median income for Black women (\$6,370) who worked year round full time in 1974 was 91 percent of the median income for comparable White women (table 31).

POVERTY STATUS: 1959 TO 1974

Persons

The earliest data available on the poverty population are for 1959. In that year, 9.9 million Blacks and 28.3 million Whites were classified as poor. Over the entire 15-year span from 1959 to 1974, the number of poor persons, both Black and White, was noticeably reduced but the decline was more pronounced among the White population. Despite the declines, substantial numbers of Blacks and Whites were still in poverty in 1974 (table 33).

The number of Blacks below the poverty level dropped from 9.9 million in 1959 to 7.5 million in 1974. While this change represents a 25-percent decline for the entire period, nearly all of the decrease occurred during the first 10 years. During the latter part of the period (1969 to 1974), the number of low-income Blacks moved within a relatively narrow range.

From 1959 to 1974, the number of Whites below the poverty level declined by 43 percent from 28.3 million to 16.3 million. Most of the decline for Whites in poverty took place between 1959 and 1969. Even though the number of such persons fluctuated between 1969 and 1974, modest reductions in the number of White poor were still noted (table 33).

Although the number of Blacks in poverty dropped between 1959 and 1969, the proportion of the poor who were Black rose slightly from 26 percent to 29 percent, which reflects the greater reduction in the number of low-income Whites over this same period. The 1974 proportion of all poor persons who were Black was about the same as that in 1969 (table 35).

In 1959, 55 percent of all Blacks were below the poverty level. This proportion dropped significantly in the subsequent 10-year period, so that by 1969, 1 of every 3 Blacks was poor. The proportion of Blacks in poverty showed little or no change between 1969 and 1974. In both 1959 and 1974, the poverty rate for Blacks was about three times that for Whites (table 33).

Families

The patterns observed for both Black families and White families below the poverty level are similar to those already discussed for poor persons. Sizable decreases were registered in the numbers of both Black families and White families in poverty over the 15-year period and, as was noted for poor persons, the largest share of these declines occurred between 1959 and 1969.

In 1959, 1.9 million Black families were below the poverty level; this number declined during the next 10 years. After an increase in the number of poor Black families between 1969 and 1970, the number leveled off in the early 1970's and remained virtually the same between 1970 and 1974. This stability represented a mixed composite of declines in poverty among low-income Black families maintained by men and increases among those maintained by women (table 34).

The poverty rate for Black families decreased from 48 percent in 1959 to 28 percent in 1969. This rate was the same in 1974 as in 1969. Between 1959 and 1974, the number of poor Black families maintained by a woman climbed from 551,000 to 1 million. Furthermore, families maintained by women have comprised an increasing proportion of all low-income Black families. In 1959, about 30 percent of all poor Black families were maintained by women; this proportion grew to 54 percent in 1969 and reached 67 percent in 1974, representing over two-thirds of all low-income Black families (table 34). The increasing proportion of poor Black families maintained by women during this period is a reflection of the increasing representation in the total Black population of families maintained by women (see table 74 in the "Family" chapter). These families have consistently had a higher poverty rate than families maintained by men (with or without wife present). The poverty rate for Black families maintained by a woman was 65 percent in 1959 and 53 percent in 1974. In contrast, during the same period the poverty rate for Black families maintained by a man (with or without a wife present) dropped from 43 percent to 14 percent.

In 1959, about 6.0 million White families were below the poverty level; the comparable figure for 1974 was 3.5 million. Over this 15-year period, the proportion of all White families in poverty declined from 15 percent to 7 percent. Between 1959 and 1974, poor White families maintained by women comprised an increasing proportion of all poor White families, a pattern which is similar to, but less pronounced than, the pattern for poor Black families (table 34).

Selected Characteristics of Poor Persons

The proportion of poor Blacks who were living in families declined slightly from 92 percent in 1959 to 87 percent in 1974. Unrelated individuals as a percent of all poor Blacks increased correspondingly during this period (table 36).

In 1974, the poverty rate for Black related children under 18 years old was almost four times the comparable rate for White children (41 percent versus 11 percent). This differential has narrowed since 1959. The vast majority (70 percent) of these poor Black children in 1974 were in families maintained by women (table 37).

In 1959, about two-thirds (62 percent) of the Black population 65 years and over were poor; this proportion had declined to 36 percent by 1974. Although the decrease has been impressive, elderly Blacks were still more than twice as likely to be poor in 1974 as their White counterparts—36 versus 14 percent (table 38). The enactment of substantial increases in Social Security benefits in the early 1970's was a major factor in the decline in poverty among the aged, both Black and White.

Relatively high rates for Black families (regardless of the person maintaining the family) continue to be associated with those living in the South or in nonmetropolitan areas, and those maintained by a person with less than a high school education, or by a nonworking person (table 39).

The majority of poor families, regardless of race, receive earnings. Among poor Black families, the proportion with earnings declined from 68 percent in 1969 to 57 percent in 1974. Over the same period, the proportion remained almost unchanged for poor White families (about 50 percent). For poor Black families with income other than earnings, public assistance was the major source of income, and the proportion of such families with this type of income increased from 45 to 60 percent between 1969 and 1974. Among poor White families, Social Security, public assistance, and dividends, interest, and rent, were the major types of income other than earnings received in 1969, 1972, and 1974 (table 40).

NOTE: The 1935-1936 income data from the Department of Labor's Study of Consumer Purchases, presented in An American Dilemma, are the earliest data tabulated on Black families. Husbandwife families were designated as "Normal families" in An American Dilemma. A "Normal family" was defined as consisting of at least a husband and wife, living together, with or without children.

NOTE: All income data in tables 14 to 32 are from Current Population. Surveys with the exception of selected 1959 data. The 1959 median income data in table 14 and the 1959 data on earning status of husbands and wives in tables 26, 27, and 28 are from the 1960 census.

The Index of Income Overlap of White and Black is a statistical measure which summarizes the degree of overlap between the two distributions and is equal to 1.00 when the two distributions are identical. Specifically, the index, which was computed on the basis of detailed income intervals, measures the sum of the commonalities expressed in terms of percents shared between Whites and Blacks for each income class interval. For more detailed explanation of Index of Income Overlap, see Bureau of the Census Technical Paper No. 22 "Measures of Overlap of Income Distributions of White and Black Families in the United States."

NA Not available.

NOTE: In tables 33 to 40, data for all years, except 1959, are based on Current Population Surveys; the 1959 data are from the 1960 census.

The poverty threshold for a nonfarm family of four was \$5,038 in 1974, \$4,540 in 1973, and \$2,973 in 1959. Families and unrelated individuals are classified as being above or below the poverty threshold, using the poverty index adopted by a Federal Interagency Committee in 1969. This index centers around the Department of Agriculture's Economy Food Plan and reflects the differing consumption requirements of families based on their size and composition, sex and age of the family head, and farm-nonfarm residence. The low-income cutoffs for farm families have been set at 85 percent of the nonfarm levels. These cutoffs are updated every year to reflect the changes in the Consumer Price Index. The poverty data exclude inmates of institutions, members of Armed Forces living in barracks, and unrelated individuals under 14 years of age. For a more detailed explanation, see Current Population Reports, Series P-60, No. 102.

III. Labor Force, Employment, and Business Ownership

LABOR FORCE AND EMPLOYMENT

In this chapter, figures on labor force and employment are sometimes presented for the same time period from two data sources—the decennial census and the Current Population Survey (CPS). The figures differ between the two sources because of variations in enumeration procedures and processing techniques. The decennial census data on labor force, which cover the period 1890 to 1970, provide a view of long-term trends, whereas statistics from the CPS (which first became available in 1948) generally permit a more detailed description of developments from 1948 to 1975.

Labor Force

The growth of the civilian labor force, in general, has been closely associated with a number of factors, such as population growth, changing demographic characteristics of the population, the overall status of the economy, and changes within various sectors of the economy. Among Blacks, the labor force (those gainfully employed) amounted to about 3 million in 1890. In a 40-year span, 1890 to 1930, the Black labor force grew to about 5.5 million. This growth was primarily because of natural population increase, but also partially the result of the expansion in the number of unskilled jobs during and immediately after World War I. In the 1930's, the growth of the Black labor force was severely curtailed by the Great Depression. This was not true to such a great extent for the White population.

A moderate increase in the number of Black workers was noted again during the 1940's as World War II brought an accelerated movement of Blacks out of the South to job opportunities in the industrial areas of the North.² In the 1950's, the growth continued as the number of Blacks in the labor force increased from 5.8 million in 1950 to 6.7 million in 1960. At the time of the 1970 census, 7.9 million Blacks were in the labor force.

The Black labor force generally grew at a slower pace than the White labor force until the middle of this century (table 41). Subsequently, the pattern changed; from 1954 to 1965, the Black labor force experienced a relatively greater increase than the White labor force (22 percent for Black and other races compared with 16 percent for White). However, more recently, from 1965 to 1970 and from 1970 to 1975, labor force levels for both Blacks and Whites have grown at approximately the same pace (table 46).

Historically, there has been a higher proportion of Blacks than Whites in the labor force. In fact, in each census year from 1890 to 1930, the proportion of Blacks who were gainfully employed was at least 10 percentage points higher than that for Whites. However, the 1940 and 1950 census data show that the labor force participation rates of Blacks and Whites had begun to converge, and by 1970, the labor force rates for these population groups were basically the same (57 percent) (table 41).

One identifiable reason for the participation rate differential between Blacks and Whites in the censuses prior to 1940 was that Black women were much more likely to be gainfully employed than White women. Since the 1940's, however, White women have been entering the labor force at a greater rate than any other group (table 42). For example, the participation rate for Black women, as indicated in table 44, showed only a small overall increase—46 percent to 49 percent—from 1948 to 1975. On the other hand, the increase in the rate for White women over this same period was rather sharp, rising from 31 to 46 percent. Thus, by 1975, the disparity in the rates between Black women and White women had narrowed substantially.

In recent decades, Black men have experienced greater losses in labor force activity than any of the other groups, as their labor force participation rate dropped from 87 percent in 1948 to 72 percent in 1975 (table 44). Black men at each age and educational level have experienced declines in labor force activity, but the declines have been particularly pronounced among teenagers, among those 55 years old and over, and among those who are not high school graduates. For example, about 9 out of 10 Black men 55 to 64 years of age were in the labor force in 1948, as compared with only 7 out of 10 in 1975. About 9 out of 10 Black men who had only 1 to 3 years of high school education were in the labor force in 1965, but by 1975, the proportion had declined to about 6 out of 10 (table 45).

¹ In the 1890 to 1930 censuses, persons in the labor force were referred to as "gainful workers." The concept "gainful worker" included all persons who usually followed a gainful occupation, although they may not have been employed at the time the census was taken. Data from the 1940 to 1970 censuses refer to the civilian labor force. The category "civilian labor force" includes employed and unemployed persons.

²The percentage increases from 1930 to 1940 and 1940 to 1950 (derived from table 41) may be affected by the inclusion of the "other" races in the 1940 data for Blacks. The figures may be an overstatement of the number of Blacks in the labor force in 1940.

The percentage of Black women in the labor force for each age group, except those 65 and over, has remained virtually unchanged or has risen since 1948. The rate for Black women without a high school education has declined since 1965, whereas the rate for Black women with at least a high school education has remained statistically unchanged (tables 44 and 45).

Employment and Unemployment

The civilian labor force consists mainly of employed persons, thus, changes in total employment for Blacks and Whites are similar to their labor force patterns. Black employment grew at a faster rate than White employment from 1954 to 1965—24 percent for Blacks and 18 percent for Whites. Between 1965 and 1970, relative gains in employment for both Blacks and Whites rose by about the same percentage (around 11 percent). From 1970 to 1975 White employment increased more rapidly than that for Blacks, so that in 1975, there were 9.1 million Black and 75.7 million White employed persons (table 46).

For most of the 27 years in the period from 1948 to 1975 (the years for which CPS data are available), the Black unemployment rate was at least double that for Whites. The exceptions to this relationship were during the late 1940's and early 1950's when the unemployment rates for Blacks were less than twice that for Whites. Also, since the Korean War period, the gap has narrowed to a ratio of less than 2.0 only in 1970, 1971, and 1975.

During this same 27-year period, the jobless rates for Blacks were lowest (ranging from about 4.5 to 5.4 percent) during the Korean War years (1951-53). After the Korean War, however, the unemployment rates for Blacks began to rise and reached very high levels between 1958 to 1963, reflecting the effects of the 1957-58 and 1960-61 recessions. The jobless rates for Blacks then declined in the mid-and late 1960's to lows of 6.7 and 6.4 percent in 1968 and 1969, respectively. In the 1970's, the proportion of unemployed Blacks climbed again, surging up to 13.9 percent during the most recent recession of 1973-75, and surpassing the previous highs of the 1958-63 period. The rate for Whites in 1975 was 7.8 percent, also the highest recorded (table 47).

Black teenagers have had the highest jobless rates and sharpest increases in these rates among all the component groups in both the Black and White populations. The unemployment rate for Black teenagers doubled between 1954 and 1975 (from 16.5 percent to 36.9 percent). On the other hand, the jobless rates for White teenagers remained fairly stable from 1954 to 1974, ranging from about 12.1 percent to 14.0 percent; then this rate increased to about 17.9 percent in 1975. The ratio of Black-to-White unemployment for teenagers was 1.4 in 1954 in contrast to 2.4 in 1974 and 2.1 in 1975. The Bureau of Labor Statistics notes that although exit from and reentry into the labor market is an important factor in teenage unemployment, most teenage joblessness has been related to attempts to find their first job (table 48)³.

Unemployed Blacks are somewhat more likely than unemployed Whites to remain unemployed for an extensive period of time. In 1957, the first year in which this type of information was available, 22 percent of unemployed Blacks had been unemployed for 15 weeks or longer, compared with 18 percent of unemployed Whites. In 1975, the comparable figures were 33 percent for Blacks and 31 percent for Whites (table 50).

OCCUPATION AND INDUSTRY

Occupation

Because of fundamental differences between the census occupation classifications in use from 1890 to 1930 and those in use from 1940 to 1970, no analyses of changes in the occupational structure for the entire period (1890 to 1970) are made in this chapter. Statistics are provided, however, for a few selected detailed occupations, which have undergone limited revisions in the entire 80-year period.

Data on occupation from the Current Population Survey (CPS) are not entirely comparable with those from decennial census statistics and, therefore, have not been included in this section; some CPS statistics on occupation for 1977 are presented in Part Two.

Occupational Changes: 1890 to 1930. In 1890, most (88 percent) of the gainfully employed Blacks worked either in agriculture, forestry, and fishing or in domestic and personal service occupations. By 1930, a substantial decline had occurred in the proportion of Blacks working in farming and related occupations. Correspondingly, there were substantial increases in Black employment, in manufacturing and mechanical occupations. These changes reflect the overall decrease in agricultural employment and the movement of Blacks out of the Southern agricultural areas to unskilled factory jobs in the North and West (tables 51 and 52).

In each of the census years, 1890 to 1930, the occupational distribution of gainfully employed Blacks differed considerably from that of Whites. White workers were more evenly distributed than Blacks among the five occupation groups shown in table 51.

The patterns of Black employment by occupation showed some variation by sex and region of residence. As was true of all employed Blacks, Black men worked primarily in agricultural jobs and, to a lesser extent, in domestic and personal service occupations in 1890. However, by 1930, the proportions in both of these occupational groups had declined, and more Black men had become engaged in other occupations such as manufacturing. On the other hand, between 1890 and 1930, Black women became more heavily concentrated in domestic and personal service occupations (table 51).

Throughout the period 1890 to 1930, Blacks living in the South were highly concentrated in agriculture, forestry, and fishing occupations, whereas Blacks living in the North and West were more likely to be employed in domestic and personal service jobs. However, during this period, both regions did register declines in the relative number employed

³ U.S. Bureau of Labor Statistics, Employment and Unemployment in 1974, Special Labor Force Report 178, 1975, p. 10.

in the occupations of heaviest concentration and increases in the proportion working in manufacturing and mechanical jobs (table 52).

Occupational Changes: 1940 to 1970. In 1940, Blacks were concentrated in the normally lowest paying, least skilled jobs-service and farm workers; few Blacks held white-collar or craft positions. However, in the 30 years following 1940, tremendous changes were made in the occupational distribution of employed Blacks. For example, in 1940, about one-third of all employed Blacks were farm workers. In 1960, this proportion dropped sharply to 8 percent, and by 1970, only about 3 percent were employed in these occupations. Blacks in white-collar occupations accounted for only 6 percent of all Black employment in 1940; by 1960, the proportion had doubled to 13 percent, with the greatest part of the gain being in sales and clerical jobs. The proportion of Black workers in white-collar occupations continued to increase in the 1960's and reached 24 percent in 1970. These changes reflected growth in the economy, a shift from an agricultural economy to a nonagricultural economy, and greater employment opportunities for Blacks (table 53).

Despite a greater degree of occupational upgrading among Black workers than among White workers, throughout the 1940-70 period, marked contrasts in Black to White job patterns persisted. While Blacks have shifted from farming and the lesser skilled fields into higher level occupations, Whites are still more concentrated than Blacks in such higher level jobs. In 1970, for example, 8 percent of all employed Blacks were professional workers, compared with 15 percent of employed Whites; the disparity was even greater in 1940.

In 1940, Black men were primarily classified as service workers. Census data indicate that during the 1940-60 period, Black men moved faster than Black women out of their respective occupations of heaviest concentration. During the 1960-70 decade, Black women advanced more rapidly than Black men into white-collar and blue-collar positions (table 53).

For Black men, the major occupational changes from 1940 to 1970 occurred in farm occupations and in the craft and operative (skilled and semi-skilled) occupations. In the farm occupations, employment levels of Black men declined significantly from 41 percent in 1940 to 4 percent in 1970. The proportion of Black men working in operative jobs (mostly skilled jobs) rose from 13 percent in 1940 to 23 percent in 1960, with an additional increase to 26 percent in 1970. By 1970, a higher proportion of Black men (onefourth) was employed in operative occupations than in any other major occupational classification. Increases were noted from 1940 to 1970 for Black men classified as white-collar workers, especially in the clerical fields. However, even in 1970, the proportions of Black men engaged in managerial and professional jobs were very small-3 and 5 percent, respectively.

The occupational changes for Black women from 1940 to 1970, on the other hand, were mainly in the white-collar and service groups. During this time, Black women moved out of service jobs and made significant gains in white-collar

occupations (except in managerial jobs). For example, the proportion of employed Black women working in sales and clerical jobs climbed from 1 percent in 1940 to 9 percent in 1960. Further increases were evident in the succeeding decade, when the proportion rose to 21 percent. Gains also were evident in the professional occupations, as the proportion of employed Black women in these jobs rose from 4 percent in 1940 to 10 percent in 1970. These expansions occurred while the percentage of employed Black women who were private household workers dropped substantially from 60 percent in 1940 to 15 percent in 1970, with the larger part of this drop taking place between 1960 and 1970. Black women did, however, have employment gains in the group "other service workers" during this period (table 53).

In 1940, the occupational distribution of Southern Blacks was very similar to that for all employed Blacks with high proportions in the lowest paying jobs—farm, laborer, and private household occupations. By 1970, however, a significant change had occurred in the occupational distribution of Southern Blacks; declines were noted in the occupations with traditionally high concentrations of Black workers and there were notable increases in the proportions of Southern Blacks employed in the professional, sales and clerical, operative, craft, and "other service" occupations.

In 1940, one-half of employed Blacks living in the North and West were in service occupations (private household and other service), and about one-third were laborers or operatives. However, the percentage of Blacks in the North and West working in the private household and laborer occupations showed appreciable declines between 1940 and 1970, and during that same period, Black employment showed gains in professional, sales and clerical, craft, and operative jobs (table 54).

Occupational Changes for Selected Professions: 1890 to 1970. In some selected professional occupations which have been very important in the Black community, changes in the census classification have been minimal over time, and trends over the 80-year span (1890 to 1970) are available.

The number of Blacks employed in certain professions—teachers, physicians and surgeons, and lawyers and judges—increased dramatically over the 80-year period; however, Black representation among all physicians and lawyers has continued to be minimal. For example, in 1970, Blacks still represented only 2 percent of all physicians and surgeons and 1 percent of all lawyers and judges. Blacks, however, have made progress in the teaching profession, increasing from 4 percent of all teachers in 1890 to 8 percent in 1970. The number of Black clergy increased from 1890 to 1910, but then began to decrease so that by 1970 there were approximately the same number as in 1890. Their relative number among all clergymen has declined significantly over the years from 14 percent in 1890 to 6 percent in 1970.

As expected, Blacks in each of these specific professional occupations were less concentrated in the South in 1970 than they were in 1890, with most noticeable decreases among physicians and surgeons, and lawyers and judges. The

South, which contained one-half of the Black population in 1970, had only one-third of the Black physicians and surgeons in that year (table 55).

Industry

The industry distribution of workers, especially Black workers, changed significantly from 1940 to 1970. These trends are basically the same as seen in the occupational comparisons over time. For example, in 1940, 62 percent of all employed Blacks were in either "agriculture, forestry, and fisheries" or in "personal services" (the industry which includes the occupation of private household workers). By 1970, however, the proportion of Black workers who were in these two industries had fallen considerably to 14 percent. Most of the shift from agricultural industries occurred between 1940 and 1960, and the movement out of personal services largely took place from 1960 to 1970 (table 56).

BUSINESS OWNERSHIP

Black-Owned Businesses and Farms

An impressive expansion of Black-owned businesses took place from 1863 to 1913 as the number of Black enterprises increased from 2,000 to 40,000 (table 57). Data for the period from 1969 to 1972 also show a growth in Black entrepreneurship. In 1972, for example, there were 195,000 Black-owned businesses, with total receipts of nearly \$7.2 billion. These figures represent about a 20-percent increase in the number of firms and an approximately 60-percent increase in gross receipts since 1969. Part of this increase in gross receipts, however, reflects the general inflation in prices during this 3-year period (table 58). The proportion of Black-owned firms to total firms (excluding corporations)

remained very small in 1972, as only 2.7 percent were Black-owned—about the same proportion as in 1969 (table 59).

In 1972, as in 1969, nearly all Black-owned firms were operated as sole proprietorships, with only 2 percent of Black businesses being organized as corporations. Black-owned firms also continued to be fairly concentrated in a few industry groups (retail trade and selected services) in both of these years, and were usually small enterprises. In addition, the largest proportion (50 percent) of Black-owned firms were located in the South, where there were 96,000 such businesses in 1972. However, the greatest percentage increases in the number of Black-owned firms (1969 to 1972) were noted in the West and Northeast (tables 58 and 59).

Black ownership has been minimal in the banking and life insurance businesses. In 1975, there were only 45 Black-owned banks and 41 Black-owned life insurance companies. Still, these 1975 figures represent some progress.

Only 10 of the 45 Black-owned banks in existence in 1975 were established prior to 1960; however, 11 were founded in the 1960 decade. Over one-half (24) of the Black-owned banks in existence in 1975 were established during the 5-year period from 1970 to 1975; of these 24 banks, 14 were located in the North. In 1975, Black-owned banks were about equally distributed between the North and South.

In contrast to banks, most of the life insurance companies were established before 1960; during the last 15 years (1960 to 1975) only three Black-owned life insurance companies were established. In 1975, most of the 41 Black-owned life insurance companies were located in the South (tables 60 and 61).

Farm ownership among Blacks decreased over the past 59 year period from 1910 to 1969. In 1910, 924,000 Blacks were full-or part-owners of farms; by 1969 however, the number was only 104,000, reflecting the general trend away from agriculture. As would be expected, most Black-owned farms have been located in the South (table 62).

Information on Black-owned businesses was first collected in a survey of minority-owned businesses conducted as a special project by the Bureau of the Census to cover the year 1969. Information on this subject for the Nation as a whole prior to this time is very limited.

NA Not available.

NOTE: In this section, data for 1960 and 1970 are from two different sources, decennial censuses and Current Population Surveys, therefore figures may vary from table to table. Data from the 1890 to 1930 censuses refer to gainful workers. The concept "gainful worker" included all persons who usually followed a gainful occupation, although they may not have been employed at the time the census was taken. It did not include women doing housework in their own home without wages and having no other employment, nor children working in the home at general household work, chores, or at odd times at other work. Data from the 1940 to 1970 censuses refer to the civilian labor force. The category "civilian labor force" includes employed and unemployed persons.

In this table, data are based on decennial censuses. Data for 1890 to 1930 are for persons 10 years old and over; 1940 to 1960, for persons 14 years old and over; and 1970 for persons 16 years old and over.

¹In the 1910 census an unusually large number of children were classified as gainful workers because of an unique instruction given to the enumerators.

²The reader should exercise caution when interpreting the 1940 census data which include persons of "other" races and therefore, may reflect an overstatement of the labor force and employment levels of the Black population.

¹Beginning in 1972, data based on 1970 census population controls; therefore, not strictly comparable with data for earlier years. Census population control adjustments were introduced in January 1972 and March 1973. The 1972 adjustment raised the employment level for Whites by about 255,000 and that for Black and other races by about 45,000. The March 1973 adjustment lowered the employment level for Whites by about 150,000, while Black and other races levels were raised by about 210,000. Unemployment levels (and rates) were not significantly affected in either year.

The change 1970 to 1975, was computed taking into account these population control adjustments.

NOTE: The information on employment and unemployment is obtained from the Current Population Survey (a monthly sample survey of households). All persons 16 years of age and over are classified as employed, unemployed, or not in the labor force for the calendar week containing the 12th of the month. The unemployed are persons who did not work or have a job during the survey week, and who had looked for work within the past 4 weeks, and were currently available for work. Also included are those waiting to be called back to a job from which they had been laid off or waiting to report to a new job. The sum of the employed and the unemployed constitutes the civilian labor force.

NOTE: In tables 53, 54, and 56, occupation and industry statistics for the census years 1940, 1960, and 1970 are not strictly comparable. However, adjustments have been made in the 1960 data to achieve as close comparability with the 1970 classification systems as possible. Since these adjustments sometimes involved estimates, the reader should exercise caution in interpreting small changes between the two censuses. In the figures for persons 14 years old and over, the "not reported" cases for 1970 are treated according to the 1960 presentation; that is, the cases allocated to major groups in 1970 are removed from those groups and combined into a separate "not reported" category. Tables 53, 54, and 56 reflect these adjustments which have been made only at the national level; the regional data for 1960 and 1970, shown in table 54, do not reflect such adjustments. See "Definitions and Explanations" for more details.

IV. Education

School Attendance

According to historical accounts, very few Blacks attended school in the 18th century and during the early part of the 19th century; educational instruction was received by a relatively large number of Blacks during the latter part of the 19th century. According to the 1890 census, enrollment levels among Black children and youth were very low; at that time, only about one-third of the 3.0 million Blacks 5 to 19 years old were attending school.¹

Impressive gains in school attendance have been noted for Blacks in the 20th century. In 1910, about 45 percent of Blacks 5 to 20 years old were enrolled in school; by 1940, the rate had climbed to 65 percent; and in 1975, 87 percent of the 8.7 million Blacks 5 to 20 years old were enrolled (table 63).

In the late 1800's and early 1900's, Blacks were much less likely than Whites to have been enrolled in school. For example, in 1890, the enrollment rate of 33 percent for Blacks 5 to 19 years old lagged 25 percentage points behind the 58 percent for the comparable group of White youth. However, the gap in school attendance between Blacks and Whites has been almost eliminated in recent years, partially as a result of compulsory attendance laws for persons of elementary and secondary school ages. In 1975, the proportion of Blacks and Whites 5 to 20 years old enrolled in school was about the same—about 86 percent.

In 1890, enrollment rates for Blacks 5 to 19 years old were lower in the South (where over 90 percent of Black school-age youth lived) than in the remainder of the Nation—31 percent in the South versus 48 percent in the North and West, a difference of 17 percentage points. Historians report that this education lag in the 19th century for young Blacks living in the South was due to several influences, including the limited acceptance of a public school system in the southern rural areas and the opposition to the education of Blacks. The differentials in school attendance between the South and the North and West have decreased significantly over the decades as rapid progress in

school enrollment has been made by Blacks in the South. Just prior to World War II (1940), the difference had been reduced to 11 percentage points; by 1970 (when 53 percent of Black school-age youth were in the South), the enrollment rate for Blacks in the South lagged only 3 percentage points behind that for the North and West (table 63).

Census data presented in tables 64 and 65 show that each age group has shared in the increased school enrollment among Blacks. Moreover, in the past 25 years (1950 to 1975), substantial increases have been noted in the proportion of Black youth enrolled in school above the compulsory attendance age (generally age 16). The growth in enrollment experienced by the age group 5 to 13 years old is due both to the increased availability of kindergarten classes to Blacks, since more public school systems, especially those in the South, now include kindergartens, and to increased participation rates at the compulsory school ages, 7 to 13.

The recent progress in school enrollment made by Blacks is also revealed by the increase in the proportion enrolled in college. The proportion of Black men and women 18 to 24 years old enrolled in college increased only slightly in the 1950's and then rose sharply in the 1960-70 decade. This upward movement has continued into the early 1970's. By 1975, the college enrollment rate was about 21 percent for Black men and women 18 to 24 years old compared with about 5 percent in 1950. This gain undoubtedly reflects the widening educational opportunities at the college level for Blacks, which resulted from the U.S. Supreme Court's historical decision in 1954 (Brown v. the Board of Education). Despite this gain, college enrollment rates in 1975 for Blacks were still much lower than those for Whites of comparable age partly because fewer Blacks of college age had completed high school (table 66).

Modal Grade

As recently as 1950, there were substantial numbers of young Black students below the modal grade for their age. In 1950, about one-half of Blacks of high school age (14 to 17 years old) were 2 or more years below the modal grade for their age. Since 1950, grade retardation has been reduced, but is still somewhat high, with about one-fifth of Black

¹ Statistics on school attendance were first collected in the 1840 census. However, school attendance data collected in the 1840 census and in the 1850 to 1880 censuses have serious limitations and defects and are not comparable with data derived from the 1890 and subsequent censuses. Thus, enrollment data for the 1840 to 1880 censuses are not included in this chapter.

² Modal grades are: 14-year-olds, high school 1; 15-year-olds, high school 2; 16-year-olds, high school 3; 17-year-olds, high school 4.

youths (14 to 17 years old) being over age for their grade of enrollment in 1970 (table 67).

Illiteracy

The measure of educational attainment first used in a decennial census was literacy, i.e., the ability to read and write in some language. In the 19th century, when relatively small numbers of Blacks received any educational instruction, illiteracy was widespread. The extension of and advances in formal schooling in the 20th century have resulted in a dramatic decline in illiteracy. In 1890, the majority (61 percent) of Blacks 15 years old and over could not read or write. By 1910, that proportion had been reduced by almost one-half to 33 percent. In 1969 (the most recent year for which data are available), only 4 percent of Blacks 14 years old and over were reported as illiterate.

The illiteracy rate among Blacks has been higher in the South than in the North and West, and for older persons (45 years old and over) than for the younger age groups (tables 68 and 69).

Educational Attainment

The importance of education to the Black community is reflected in the tremendous strides made by young Blacks in achieving higher educational levels. Hurley H. Doddy has noted that as members of a minority group that has suffered economic and cultural disadvantages, Blacks have always placed a special significance on acquiring higher education. It provided them with economic and social advantages.³

The proportion of Black young adults who have completed high school has been growing steadily since infor-

mation was first collected on this subject in the 1940 census. The increases since 1960 have been especially marked. Only about 1 out of 10 Blacks 25 to 34 years old was a high school graduate in 1940; the proportion was approximately 3 out of 10 in 1960; by 1975, the proportion had risen to 7 out 10 (table 71).

The proportion of Black young adults completing high school has increased more rapidly than that of Whites during the 35-year period (1940-1975), substantially narrowing the educational differentials between the two population groups since 1940. Yet in 1975, the percentage of Blacks 25 to 34 years old who were high school graduates was 13 percentage points below the figure for Whites.

The proportion of Blacks 25 to 34 years old who have completed a college education has increased considerably since 1940, from a minute proportion (2 percent) in that year to 11 percent in 1975. However, the proportion of Black young adults who are college graduates has consistently lagged behind that of Whites, so that in 1975, Whites were still twice as likely as Blacks to be college graduates (table 71).

Some variations in the level of schooling completed are evident between Black young adults living in the South and those in the North and West. The proportion of Blacks in the South completing high school has been persistently lower than that in the North and West; in fact, the disparity has remained unchanged over the past 35 years (1940 to 1975). In 1940, only 8 percent of Southern Blacks 25 to 34 years old had completed high school, as compared to 20 percent in the North and West. By 1975, the proportions were 63 and 75 percent, respectively, for the South and the North and West. Contrary to the patterns for high school graduates, percentages of Blacks 25 to 34 years old who were college graduates in the South were generally about the same as those in the North and West (table 71).

³ Hurley H. Doddy, "The Progress of the Negro in Higher Education" Journal of Negro Education, Vol. 32, No. 4, Chapter XV, 1963, p. 485.

¹Regional data for 1890 and all data for 1940 and 1960 include persons of "other" races.

NOTE: In this section, with the exception of tables 65 and 66, data presented for school enrollment and years of school completed for the years 1890 through 1970 are from the decennial censuses; data presented for 1975 are from the Current Population Survey. All data in table 65, and the 1970 data in table 66 are from the Current Population Survey. The month the data were collected varies with the source; census data were generally collected in April, whereas Current Population Survey information on enrollment was gathered in October and on attainment in March. Therefore, because of different procedures, month of enumeration, etc., census data are not directly comparable with Current Population Survey data.

For the source of the illiteracy data shown in this section, see the note on table 68.

In this table, the 1890 data are for ages 5 to 19 and are partially estimated. Data for regions are not available after 1970.

²Regional data for 1970 include persons of "other" races.

¹Regional data for 1890 and all data for 1947 and 1959 include persons of "other" races.

NOTE: In the censuses of 1870 to 1930 two questions—one on the ability to read and one on the ability to write—were asked of the total population 10 years old and over. Illiteracy was defined as the inability to write "regardless of ability to read." Since 1930, the questions were combined and reference has been made as to whether or not the person was able to read and write. The data shown for subsequent years were obtained from the Current Population Survey and refer to the population 14 years old and over. For 1947, the literacy question was asked only of persons who had completed less than 5 years of school. For 1959 and 1969 the literacy question was asked only of persons who had completed less than 6 years of school. Therefore, census data are not strictly comparable with Current Population Survey data.

In this table, data for 1890, 1910, and 1930 are for persons 15 years old and over. Data not available by region after 1930.

V. Family

Number and Size of Households

Between 1890 and 1975, there was a fivefold increase in the number of Black households from 1.4 to 7.3 million. During the same period, there was almost a sixfold increase in the number of White households. During the first three decades of this century, the number of households increased at a slower rate for Blacks than for Whites. In the 1940's and 1950's, the rate of increase was similar for Black and White households. Since 1960, however, the number of Black households has risen at a faster pace than White households (52 percent compared with 31 percent). Some of the recent changes since 1960 in the differential growth rate between Black and White households reflect the higher rate of population growth among those Blacks most likely to form new households (table 73). For example, the rate of growth during the 1960 decade among young Black adults age 18 to 34 was 36 percent as compared with 25 percent for White persons of the same age. One additional contributing factor had been the more rapid increase in the number of Black than White married couples who have separated or divorced and have subsequently established separate households.

Since 1890, the average number of persons per household has declined for both Blacks and Whites. For instance, in 1890, the average size of Black households was 5.3 persons, and in 1975, it was 3.3 persons (table 73). The reduction in household size has been related to declining fertility and other factors, such as recent increases in the number of young persons living alone and elderly persons maintaining their own households after their families have dissolved.

Families by Type and Distribution

Most of the discussion on changes in the structure and composition of the Black family relates to the past 35 years; this is because a reliable series of Census data on this subject is only available after 1940. A family is defined as two or more persons living together and related by blood, marriage, or adoption.

Between 1940 and 1975, the number of Black families doubled—from 2.7 to 5.5 million. During the same period, the number of White families increased by about 72 percent. The numerical increase in Black families is a result of substantial increase in both families maintained by a woman with no husband present and husband-wife families; by

contrast, husband-wife families have accounted for most of the growth in White families.

One indicator of the change in the structure of the traditional family unit is the proportion of all families which include both a husband and a wife. The 1940-75 period has been characterized by a downward trend in the proportion of Black families with a husband and wife present. In 1940, husband-wife families accounted for 77 percent of all Black families; by 1975, the figure was down to 61 percent. During this same time span, the proportion of White husband-wife families of all White families showed little change (table 74).

The decline in the proportion of Black husband-wife families of all Black families has been evident not only in the South, but also in the North and West. Although there were marginal differences in the regional figures, they did not give any real evidence that Southern Black families have been either more or less successful at avoiding family fragmentation than their Black counterparts in the North and West (table 76).

Families Maintained by a Woman

The proportion of Black families maintained by a woman with no husband present has doubled since 1940. These families constituted about 35 percent of all Black families in 1975, compared with 18 percent in 1940. The increased frequency of Black women maintaining families may be largely accounted for by both high rates of marital discord (separation and divorce) and increased proportions of single (never married) women maintaining families.

In 1975, about 11 percent of all White families were maintained by women without a husband living with the family, a proportion that has shown little change since 1940 (tables 74 and 78).

Differences in the characteristics of Black and White women maintaining families are very evident. In 1975, about 31 percent of the Black women maintaining families were separated and 19 percent were divorced. In contrast, 15 percent of the comparable White women were separated and 33 percent were divorced. The Black-White differentials in the marital status of these women may reflect differences in both the social acceptability of separation versus divorce and the relatively greater financial ability of Whites to pay for a divorce (table 78).

Never-married women comprised about 9 percent of all Black women maintaining families and 12 percent of their White counterparts in 1950. By 1975, however, the relationship was reversed; the proportion of families maintained by a woman who had never been married was considerably higher for Blacks (22 percent) than for Whites (9 percent). This recent difference partially reflects the relatively higher incidence of births to unmarried Black women.

Black families maintained by women were more likely than the comparable group of White families to include children. In 1950, the proportion of Black families maintained by women with at least one own child under 18 was 47 percent, compared with 33 percent for Whites. In 1975, the corresponding proportions for Blacks and Whites were 71 and 57 percent, respectively (table 78).

Living Arrangements of Children

About three-quarters of all Black children under 18 lived with two parents in 1960, whereas only about one-half (54 percent) were living with both parents in 1975. In 1960, about 93 percent of White children under 18 lived with both parents; the corresponding figure for 1975 was 87 percent (table 79).

For both Blacks and Whites, the proportion of children living with both parents appears to be associated with family income. For example, among Black families with incomes under \$4,000, less than one-fifth of the Black children lived with both parents in 1975. At the \$15,000 and over income level, most (86 percent) Black children were living with both a mother and a father (table 80).

Marital Status of the Population

The marital status distribution for Black men and women 14 years old and over for the years 1890 to 1975 is presented in table 81. The distribution has been strongly affected by the age composition of the Black population. To eliminate the influence of changing age structure, the discussion of marital status has been restricted to those 35 to 44 years old (table 82). Paul C. Glick has noted that the age group 35 to 44 years "may be characterized as 'approaching middle age' and is especially relevant because it covers a stage in life when

most of those who will ever marry have done so and when the proportion of persons who are divorced is at or near its height." $^{\rm I}$

In 1890, about 11 percent of Black men and 7 percent of Black women 35 to 44 years old were reported as single (never married) and 83 percent of the men and 75 percent of the women were reported as married. By 1940, the proportions single had increased and the proportions reported as married had decreased over the 1890 levels. During the next 20-year period (1940 to 1960), there was a general shift in the marital status distribution for Black men and women resulting in smaller proportions who were single and larger proportions who were married. Thus, in this century, the percent married was at its peak for Blacks during the 1940-60 period (table 82).

In the 15 years since 1960, the proportion of Black women 35 to 44 years old who were married has declined while the proportion for Black men remained unchanged and little variation has been observed in the percent single.

In 1975, among Black men 35 to 44 years old, 1 percent were widowed and 7 percent divorced; corresponding proportions for Black women were 7 and 11 percent, respectively. Divorce has become more common and widowhood less common during the 85-years since 1890, with most of the change occurring after the 1940's. The decline in the proportion widowed has been due to general improvements in the life expectancy of Black men. The marital status trends for the White population have been generally similar to those for the Black population (table 82).

Larger proportions of Black men than of Black women 35 to 44 years old have consistently been reported "married" in each of the census years shown in table 82. The differences were at a minimum in the 1960 census possibly as a result of the peak in marriages during the 1940-60 period. Among other dissimilarities are larger proportions of single Black men than women, but larger proportions of widowed or divorced Black women. Variations in age structure, age at first marriage, rate of remarriage, and misreporting of marital status may account for some of the differentials.

VI. Health: Mortality and Fertility

MORTALITY

Historical Trends

The long-term trend of substantial increase of life expectancy at birth, which began in the late 1800's with the public health movement, continued well into the 20th century. In the early 1900's, the expectation of life for the Black population was about 16 years less than that of the White population.¹ (In the 1900-02 period, expectation of life at birth for Black males and females was about 33 and 35 years, respectively.) Greater relative gains in life expectancy on the part of the Black population during the 20th century have greatly reduced this differential. Nevertheless, as of 1974, Black males and females had a life expectancy at birth of 63 and 71 years respectively, which was still about 6 years less than their White counterparts (table 84).

Three phases in a mortality transition for the Black population in the 20th century were roughly delineated by the two World Wars.² During the first two decades of this century when the Black population resided principally in the rural South, expectation of life at birth was around 35 years; the White population had a life expectancy of about 50 years. The decade between 1909-11 and 1919-21 was characterized by tremendous gains in life expectancy (13 years for Black males and over 9 years for Black females). Steady improvements were made in the expectation of life during the 1920's and 1930's culminating in another large increase after World War II when the Black-White differential was reduced to less than 8 years. The present phase so far has been characterized by a slow improvement in life expectancy for Black men (a 4-year gain between 1949-51 and 1974), but a relatively rapid gain for Black women (8.5 years since 1949-51). For both sexes, Blacks have made relatively greater gains than Whites in life expectancy since World War II (table 84).

There are several reasons for the two peaks in the gain in life expectancy for both the Black and White populations

centering around World War I and World War II. Aside from the improved medical techniques and drugs introduced during the war years and the GI benefits derived by spouses of Armed Forces personnel, major changes in the economic structure of the Nation during the war years produced substantial geographic shifts in the Black population to northern and urban areas with better educational institutions and health service delivery systems.

Age Differentials

Since 1940, the most significant gains in life expectancy have occurred at the younger ages although smaller gains have been made at the older ages for both Blacks and Whites. Whereas Black-White differentials in life expectancy at birth have decreased due to relatively greater declines in infant mortality for Blacks, little progress has been made among middle-aged people (tables 85 and 86).

An increasing differential in the number of additional years of life expected emerges, however, between Black males and females at all ages (table 85). For example, in the 1939-41 period, Black men 25 years old expected 35.9 additional years of life while the comparable group of women expected 38.3 additional years, a difference of 2.4 years. By 1974, this gap had widened to 7.3 years. The principal reason for this diverging trend at age 25 was the rapid fall in maternal mortality rates at the childbearing ages (15 to 44 years old) (table 86). High maternal mortality rates among Black women in the early part of this century were substantial enough to raise the overall mortality rate for all Black women in the childbearing ages above the rate for men at the same ages.³

Examining the age-specific death rates for both the Black and White populations show that Blacks have substantially higher death rates than Whites except at the oldest ages (75 years and over). A possible reason for this reversal involves inaccuracies in age reporting for the Black population at the older ages. In recent years, Blacks have had a lower crude death rate than Whites, despite the fact that Whites have had both lower mortality rates at all ages (except the oldest) and

¹ In this section, the term "Black" is used in the text although the data may be for "Black and other races." Blacks constitute about 90 percent of this group.

percent of this group.

² For a detailed analysis of this transition, see S.L.N. Rao, "On Long-Term Mortality Trends in the United States, 1850-1968."

Demography, Vol. 10, No. 3 (August 1973), pp. 405-419.

³ Mortimer Spiegelman, Introduction to Demography, rev. ed. (Cambridge: Harvard University Press, 1970), p. 90.

have a higher life expectancy. The lower death rate for the Black population is due to the young age distribution of the Black population (table 87).

Causes of Death

Early in this century, the principal causes of death were the infectious diseases of tuberculosis, pneumonia, influenza, and typhoid fever, and the principal childhood diseases such as scarlet fever, diphtheria, whooping cough and measles. In 1910, these diseases accounted for 37 percent of all Black deaths and 26 percent of all White deaths. By 1974, their proportion of the total number of deaths had fallen to only 3 percent for both races (tables 88 and 89).

Tuberculosis, once called the "great white plague," was the chief cause of death for the Black population in the early 1900's. With an improved standard of living, X-ray examinations to detect the disease in its early stages, and the use of antibiotics and other drugs, death rates from tuberculosis have declined sharply among both the Black and White populations.

As the diseases of infancy, youth, and middle age were increasingly brought under control, diseases of old age became proportionately more important among the causes of death. In 1910, deaths due to malignant neoplasms (cancer) and diseases of the heart accounted for 12 percent of all Black deaths and 16 percent of all White deaths; these same diseases constituted 46 percent of all Black deaths and 58 percent of all White deaths in 1974.

A diverging trend in rates of accidental death can be seen in tables 88 and 89 depending on the type of accident. Deaths due to motor vehicle accidents, which climbed rapidly for both Blacks and Whites between 1910 and 1930, have stabilized between 21 and 29 deaths per 100,000 population since 1940 for both races. Accidental fatalities excluding motor vehicle accidents have continuously fallen for both races and by 1974 were only 30 percent of the level recorded in 1910. For both the Black and White populations, death rates due to homicide have approximately doubled between 1960 and 1974; the rate for 1974 was 39.7 deaths per 100,000 for the Black population and 5.8 deaths per 100,000 for the White population (tables 88 and 89).

FERTILITY

Estimates of fertility rates for the United States, based on annual numbers of registered births, do not exist for the years prior to 1915, and estimates for Black women are not available prior to 1960. However, statistical reconstruction through demographic methods can provide estimates of fertility for the years before information was available from vital statistics. According to these estimates (not shown in the tables), the total fertility rate for Black women in the 1850's was about 7.9 per woman. This measure means that if the birth rates which prevailed in the 1850's at each year of age for women in the childbearing ages were to prevail

throughout the reproductive life for a particular group of women, they would bear an average of 7.9 children during their lifetime.⁵ One hundred years later, in 1950, the total fertility rate for Black women was about 3.6 births per woman (table 90). However, the 7.9 figure for the 1850's was recorded in a period in which fertility rates were declining from even higher levels at the beginning of the 19th century, whereas the rate for the 1950's occurred at the time when fertility rates were rising—during the "baby boom" after World War II.

After a century or more of decline, fertility rates among Black women, as was also true among White women, reached a low level during the depression years of the 1930's. In that decade, the annual total fertility rate for Black women averaged about 2.7 births per woman. In 1960, just 3 years after the peak year of the "baby boom," the total fertility rate for Black women was 4.5 births per woman (table 90), an increase of 66 percent from the average in the 1930's. By 1975, the total fertility rate for Black women had fallen to an all-time low of 2.3 births per woman, a decline of 50 percent in a decade and a half (table 90).

The increases and decreases in the total fertility rate occurred during the same time periods for Black and White women, although the levels for White women have always been substantially below those of Black women. In the middle of the 19th century, when the total fertility rate for Black women was 7.9, the corresponding rate for White women was about 5.3, an average of over 2.5 children per woman less than among Blacks. During the 1930's, the average annual total fertility rate for Whites was about half a child per woman lower than that of the Blacks; by 1960, the difference between the races had increased to almost one child. Currently, with both races posting record lows, the annual total fertility rate for White women is still averaging over half a child less than that for Black women.

Whereas the total fertility rate is a summary measure of birth rates for all years in the reproductive period, the rates shown in table 91 are specific to designated 5-year age groups. Unlike the rates in table 90 which are on a per-woman basis, the age-specific rates of table 91 are averages per 1,000 women. For all ages shown, the rates for Black women are almost always higher than those for White women. An exception to the general rule occurs for women 25 to 29 years old in 1970 and in 1975.

Although fertility rates have declined since 1960 for both Black and White women, the rate for Whites appears to have declined slightly more rapidly than that for Blacks.⁶ In 1960, the total fertility rate for Black women was 128 percent of

⁶ For a different view on the relative difference in the decline of White and Black fertility rates, see James A. Sweet, "Differentials in the Rate of Fertility Decline: 1960-1970," Family Planning Per-

spectives, Vol. 6, No. 2 (Spring 1974), pp. 103-107.

⁴ National Center for Health Statistics, Vital Statistics of the United States 1973, Vol. I—Natality, p. 4-3.

⁵ For estimates of fertility for Black women see Ansley J. Coale and Norfleet W. Rives, Jr., "A Statistical Reconstruction of the Black Population of the United States: Estimates of True Numbers by Age and Sex, Birth Rates, and Total Fertility," Population Index, Vol. 39, No. 1 (January 1973) pp.3-36; for estimates for White women see Ansley J. Coale and Melvin Zelnik, New Estimates of Fertility and Population in the United States (Princeton: Princeton University Press, 1963).

that for White women; by 1975 the corresponding ratio had risen to 136 percent (table 90).

The fertility rates shown in tables 90 and 91 are measures based on births occurring in the stated year. Tables 92 and 93 show measures of fertility which are cumulative to the stated year; that is, they are based on births to women in a stated age group which have occurred during the lifetime of those women up to the date of the survey. Average numbers of children born to ever-married women are shown in the final column of table 92 and in table 93.

Women in their forties may be regarded as having completed their reproductive career, even though a few women do bear children after age 39. In 1910, Black women in their forties who had ever been married had borne an average of almost six children per woman. These were women whose prime years of childbearing occurred in the last two decades of the 19th century. In 1960, the corresponding average had dropped to about three children per woman, but in this case the women had spent many of their principal reproductive years in the late 1920's and 1930's when fertility rates were relatively low. By 1970 and 1975, the effects of "baby boom" fertility were reflected in the average number of children ever born to Black women 40 to 49 years old, with the average being close to four in 1975.

The data in table 92 suggest that by 1995 the average number of children ever born for Black women (who at that time will be 40 to 49 years old) may well have returned to the 1960 levels. In 1975, Black women in their twenties averaged about 1.7 children per ever-married woman, as compared with the 1940 average of 1.6 children per ever-married woman 20 to 29 years old. If the women 20 to 29 years old in 1975 average about as many children in the next 20 years as did those who were 20 to 29 years old in 1940, the 1995 and 1960 averages for women in their forties could be quite similar. In fact, the 1995 averages could be significantly lower than the 1960 averages, since the means of controlling fertility are more effective and widely used now than they were 35 years ago.

The data in table 93 illustrate the well-documented relationship between fertility and educational attainment. Women with fewer years of education almost always have higher average numbers of children ever born. This inverse relationship may be due in part to the fact that women who remain in school longer usually marry at a later age and have fewer years of childbearing within marriage. But it may also

be the result of different values relating to family formation and childbearing and knowledge about and acceptance of methods of family limitation.

An interesting difference in the fertility of Black women and White women is seen in table 93. As has been noted, White women almost always have lower fertility rates than the corresponding group of Black women. However, among ever-married women 35 to 44 years old, Black women with 4 or more years of college education had lower average numbers of children ever born than did the corresponding group of White women in each of the years shown.

Births classified as illegitimate are becoming an increasingly large percentage of all births to both Black and White women. In 1940, about 17 percent of all births to Black women occurred out of wedlock; in 1975 out-of-wedlock births accounted for 49 percent of all Black births, an increase of 163 percent in 35 years. At the same time, the corresponding increase among White women from 1940 to 1975 was 265 percent. The actual percentages of illegitimate births, however, were much lower among White women at both dates (table 94).

Although illegitimate births continued to be an increasing percentage of all births to Black women until 1975, the highest illegitimacy rate appears to have occurred around 1960. The fact that the percentage of all births that are illegitimate continued to rise while the illegitimacy rate was decreasing is due to a combination of factors: first, the numbers of unmarried women 15 to 24 years old have been increasing, and it is in these ages that the highest rates of illegitimacy occur; second, even though illegitimacy rates have been declining recently, rates of legitimate births have been declining even faster. B

The 1975 illegitimacy rate for unmarried women 15 to 44 years of age declined from the 1970 levels for both races. Among Black women this was also true for each 5-year age group shown in table 95. Among unmarried White women 15 to 19 years of age, however, the rate per 1,000 increased slightly over the 5-year period (table 95).

⁷The illegitimacy rate for women 15 to 44 years old of "Black and other races" was 100.8 in both 1959 and 1961. Since 1961 this rate has declined to the 1975 level of 80.4, although some years showed a minor increase over the preceding year during the 1961-75 period. See National Center for Health Statistics, op. cit., table 1-30.

¹Data for 1970 and 1975 are for Black only.

NOTE: As stated in the source, "No estimates are included for misstatements on the birth record or for failure to register births...The decision to conceal the illegitimacy of births is likely conditioned by attitudes in the mother's social group towards her and towards children born out of wedlock. Also, the ability (economic or otherwise) to leave a community before the birth of the child is an important consideration. These factors probably result in proportionately greater understatement of illegitimacy in the White group than in Negro and other races...."

A small number of States do not report the legitimacy status of births. The number of illegitimate births occurring in the nonreporting States is estimated by the National Center for Health Statistics. For the extent of coverage of legitimacy status, and the method of estimation for nonreporting States, consult the annual natality volumes of <u>Vital Statistics of the United States</u>. Beginning in 1970, data exclude births to nonresidents of the <u>United States</u>.

²Rate computed by relating total illegitimate births, regardless of age of mother, to unmarried women 15 to 44 years old.

VII. Housing

Occupancy Characteristics

Home ownership has increased among Black households, particularly since 1940, as a result of several factors: increasing income levels, high rates of marriage and household formation, and Federal governmental programs to facilitate home ownership. In 1890, 19 percent of Black households lived in homes they owned; half a century later, the proportion had moved only slightly to 23 percent. From 1940 to 1970, the rate of owner occupancy for Black households increased steeply to 42 percent. More recent figures available from the Annual Housing Survey (conducted by the Bureau of the Census under the sponsorship of the Department of Housing and Urban Development) indicate that the 1975 homeownership rate of 44 percent was slightly higher than the 1970 census figure.

Home-ownership rates for Black households have been consistently lower than those for White households since 1890, however, the disparity has diminished over the years. In 1890, the owner-occupancy rate was 19 percent for Black households compared to 51 percent for White households. In 1975, the comparable rates were 44 percent and 67 percent, respectively. It is important to note that the 1975 homeownership rate of 44 percent for Black households had not yet reached the 1890 rate for White households (tables 96 and 97).

In 1890, the home-ownership rate for Black households was lower in the South than in the North and West (18 percent in the South versus 28 percent in the North and West). By 1940, the relationship had reversed; the homeownership rate was 24 percent in the South and 19 percent in the North and West (table 98). Since 1940, the gap between the South and the North and West has widened as a result of greater gains in home ownerhip for the South. In 1975, 49 percent of Black households in the South owned their own homes compared to 39 percent in the North and West (tables 97 and 98).

Plumbing Characteristics

Since 1940, the percentage of Black-occupied housing units lacking some or all plumbing facilities has declined drastically; most of the decline occurred in the 1940-60 period. In 1940, 3 out of 4 units occupied by Blacks lacked some or all plumbing facilities; by 1960, the proportion had dropped sharply to 1 out of 4, and further reductions were

observed in the 1970 census. By 1975, 1 out of 11 Black households had incomplete plumbing. Even with these declines, in 1975, this proportion was still much higher than the comparable figure for White occupied housing units.

Both the South and the North and West have shown declines since 1940 in the proportion of Black households with incomplete plumbing. In fact, for the North and West, by 1975, the proportion of Black households with incomplete plumbing was very low—2 percent. The comparable proportion for the South was 15 percent, reflecting, to some extent, the greater prevalence of housing units lacking such facilities among rural dwellers who comprise a greater share of the South's population (tables 99 and 100).

In 1975, the South was the only region for which there was a marked difference between Black and White households in the availability of plumbing facilities (table 100).

Utilization Characteristics

Earliest data available on persons per room for Black and White households (1935-36) show that urban Black households in three areas of the country (South, East, and Central) had a higher proportion of housing with 1.5 or more persons per room than did their White counterparts. Decennial census information, which first became available in 1940, indicates that, regardless of tenure or area of residence, the percentage of Black households with 1.01 or more persons per room was higher than the comparable percentage for White households. For example, in the South, the proportion of owneroccupied Black households with 1.01 or more persons per room was half again as high as that of White households (33 percent versus 21 percent). Similar patterns were evident in the North and West and in urban and rural areas. According to Federal legislation, housing units having 1.01 or more persons per room are considered as overcrowded (tables 101 and 102).

From 1940 to 1970, overcrowding decreased among Black households, both renter- and owner-occupied, for all areas of the Nation. Among renter-occupied households with 1.01 or more persons per room, the percentage decreases in the rate of overcrowding were about the same for the South as for the North and West (about 39 percent), whereas for owner-occupied households, the percentage decreases were greater in the North and West than in the South—52 percent and 42 percent, respectively (table 102).

Table 96. Tenure of Occupied Housing Units, for Selected Years: 1890 to 1970

		Black		White			
Year	Total	Owner occupied	Renter occupied	Total	Owner occupied	Renter occupied	
1890. 1910 ¹ . 1940. 1960 ² . 1970.	1,411 2,173 3,157 5,144 6,180	264 507 720 1,974 2,568	1,146 1,666 2,437 3,171 3,612	11,255 17,609 31,561 47,880 56,529	5,794 8,577 14,418 30,823 36,979	5,462 9,031 17,143 17,057 19,551

1890. 1910 ¹ . 1940. 1960 ² .	100 100 100 100 100	19 23 23 38 42	81 77 77 62 58	100 100 100 100 100	51 49 46 64 65	49 51 54 36 35	

NOTE: The first nationwide census of housing was taken in 1940. In 1940, 1960, and 1970, a housing (dwelling) unit was defined in general as the living quarters occupied or intended for occupancy by one household. Figures for 1890 and 1910 rest on the fairly close correspondence between the concept of occupied housing unit used in the housing censuses since 1940 and concepts used in previous censuses of population.

The number of occupied housing units is closely comparable to the number of households shown in the family chapter. Since 1950, the number of occupied housing units has been identical by definition to the number of households.

VIII. Voting, Elected Officials, and Armed Forces

VOTING AND REGISTRATION

Blacks made significant advances in voter registration and participation in the 1960's as a result of the Voting Rights Act of 1965, the civil rights movement, and voter registration drives. However, data from the Census Bureau's Current Population Survey show that the gains in voter participation made in the 1960's were not maintained in the 1970's. In fact, for both Blacks and Whites, there has been a general decline in voter participation since the 1968 general election.¹

Voter Registration

About 6.3 million Blacks of voting age reported that they had registered to vote in the Congressional election of 1966 (the first year information on registration was collected by the Census Bureau). Six years later in the Presidential election of 1972, the number of Blacks registered had risen by 2.5 million to a high of 8.8 million.² In the 1974 Congressional election, the number of Blacks registered was about 7.8 million. Congressional elections generally produce lower registration and voter participation rates among all population groups than Presidential elections.

In the Congressional elections of 1966 and 1970, 60 percent of Blacks of voting age reported that they registered. The rate moved upward to 65 percent for the 1972 Presidential election, then fell to 55 percent for the Congressional election of 1974. The registration rate of 55 percent for Blacks of voting age in 1974 was the lowest rate reported for any of the five general elections from 1966 to 1974 (table 103).

In the South, the most impressive gains in Black registration were made since the mid-1960's. According to the Southern Regional Council, Black voter registration rose from 2.1 million in March 1964 to 2.8 million in June 1967 (an increase of 30 percent) for 11 States in the Southern region.

Census survey information reveals that for the South as a whole, the number of persons in the Black electorate who were registered increased by 1.4 million during the 6-year

period from 1966 to 1972. Registration levels for Blacks in the South reached their peak in the November 1972 Presidential election. The high registration level in the South was maintained in the 1974 Congressional election, while at the same time, Black registration declined for the entire

In 1966, about 53 percent of Blacks in the South were registered. The reported rate increased by 11 percentage points to 64 percent for the 1972 Presidential election. The registration rate for the Congressional election of 1974 was down to 55 percent, about the same as in the 1966 election.

The peak registration rates for Blacks in the North and West occurred during the Congressional election of 1966 and the Presidential election of 1968 when 69 and 72 percent, respectively, reported being registered. The 1974 rate in the North and West was much lower than that noted for any of the other four general elections (table 103).

Voter Participation in Presidential Elections

About 6.0 million Blacks, or 58 percent of all Blacks of voting age, reported that they cast their ballots in the 1964 Presidential election. This voter-participation rate was maintained in the 1968 election. However, the proportion who voted declined about 6 percentage points in the 1972 election (table 104).³

In each Presidential election from 1964 to 1972, the voter turnout was lower for Blacks than for Whites. However, the voter turnout patterns of Whites were similar to those for Blacks; i.e., the reported voter-participation rate in 1972 for Whites (64 percent) was also below that in either 1968 or 1964.

Voter-participation rates for Blacks have varied by region. Rates for the South have been much lower than for the North and West; yet the only advance in voter-participation rates in the 1960's was made in the South. In the South, the proportion of Blacks of voting age who voted increased from a relatively low rate of 44 percent in 1964 to 52 percent in 1968. There is some evidence that the proportion declined to 48 percent in 1972. On the other hand, in the North and West, the percentage of Blacks who reported that they voted dropped in both the 1968 and 1972 elections from a level of 72 percent in 1964 (table 104).

¹ Data on voting patterns have been collected by the Census Bureau only since 1964. Therefore, an analysis of long-term trends on this subject is not presented in this section.

² Data for the 1976 Presidential election presented in Part Two show that 8.7 million or 58 percent of all Blacks of voting age were registered.

³In the 1976 Presidential election, 49 percent of all Blacks of voting age reported that they voted (see Part Two).

Voter-participation rates are strongly influenced by age and educational attainment. Rates for Blacks in 1972 were highest for the population 45 to 64 years old and lowest for the age group 18 to 24 years old. Voter turnout tends to increase as the educational levels increase. For example, in 1972, about 55 percent of Blacks with 4 years of high school voted; the rate was about 80 percent for those with 4 years or more of college.

A similar pattern of voter participation by age was evident for Whites. Also, the rates for Blacks and Whites are similar at selected elementary and college levels (tables 105 and 106).

Voter Participation in Congressional Elections

Congressional election turnouts are generally lower than Presidential election turnouts for both Blacks and Whites. Among Blacks, the voter-participation rate was about the same in 1966 and 1970. The turnout in 1974 was about 10 percentage points lower than the 1970 election.

Between the 1966 and 1970 elections, there was some evidence that Blacks in the South experienced increases in voter participation, whereas those in the North and West showed no changes in their participation. Black voter turnout was lower in both the South and the North and West in 1974 than it was in 1966 and 1970 (table 104).

ELECTED OFFICIALS

There have been only two periods of history in which Blacks have been elected to public office in any appreciable number—during the Reconstruction period and since 1965.

During the Reconstruction period (considered here as the period from 1869 to 1901), a total of 22 Blacks, all from the South, were elected to Congress. Nearly all of the Blacks who were elected during this time served in the House of Representatives. Two Blacks were elected to the U.S. Senate from Mississippi.

About one-half of the 17 Southern States elected Blacks to Congress. (All of the States with Black Congressmen were part of the Old Confederacy.) The largest number of Representatives (eight) came from South Carolina; North Carolina ranked second with four Representatives (table 108).

The greatest number of Black officials, whether elected or reelected to any one Congressional term during Reconstruction, was seven, which occurred for the 1873-75 and 1875-77 terms. This number was not matched again until the 1967-69 Congressional term. Near the end of the Reconstruction period (1891 to 1901), the number elected to Congress had dwindled to one (table 107).

The number of Blacks who held State office was also relatively large (794) during the period from 1869 to 1901. South Carolina had the greatest number of Black State legislators (210) and Louisiana ranked second with 121 Black legislators. Four Southern States had no Black legislators (table 108).

According to The American Negro Reference Book, Blacks filled many local elective and appointive offices during the Reconstruction period; however, the exact number in these local offices is difficult to ascertain.⁴

During the three decades immediately following the Reconstruction period (1901 to 1929), no Blacks were elected to Congress. When a Black Representative from Illinois entered the U.S. House of Representatives in 1929, 28 years had elapsed since the last Black had served in Congress.⁵ The period from 1929 to 1965 continued to see few Blacks elected to Congress. The small number who were elected resided in the North and West (table 107).

Since the mid-1960's, there has been a tremendous surge in the number of Blacks elected to public office. This increase was a result of the Voting Rights Act of 1965, the Voter Education Project, the civil rights movement, and other similar efforts which began in the 1960's. The total number of Blacks elected to public office in this country increased markedly from 103 in 1964 to 3,503 in 1975. However, Blacks still comprised only a very small proportion (less than 1 percent) of all elected officials in the Nation. The number of Blacks elected to the House of Representatives increased from 5 in 1964 to 17 in 1975 (table 109).

The South, which contained 53 percent of the Black population in the United States in 1975, accounted for 55 percent of all elected Black officials. Forty-four percent of Black State legislators and executives and 61 percent of all Black mayors elected that year resided in the South.

A striking increase has been noted in the number of Black mayors—from 48 in 1970 to 135 in 1975. Blacks are now mayors of cities in about one-half of the 50 States. Although the majority of Black mayors were holding office in small towns and communities, several were holding office in some of the Nation's larger cities (table 109).

Historically, few women, regardless of race, have been elected mayors, State legislators and executives, or to the U.S. Congress. Some changes in this pattern are apparent. For instance, the total number of Black women holding public office has increased from 131 in 1969 to 530 in 1975. In 1975, there were 9 Black women mayors and 35 State legislators and executives. However, these women still represent only 15 percent of all Black elected officials and hold positions primarily in educational fields and at the municipal level (table 110).

Gains have been noted since the mid-1960's in the number of Black judges appointed by the President. From 1963 to 1969, there were 18 judges appointed, about the same number appointed during the entire 1901-63 period. This increase has continued into the 1970's when 20 judges were appointed by the President during the 1969-75 period.

⁴ John P. Davis, ed., The American Negro Reference Book, (Englewood Cliffs, N.J.: Prentice-Hall, Inc., 1971), p. 420.

⁵ Ibid. pp. 424 and 443.

⁶ Joint Center for Political Studies, Washington, D.C., National Roster of Black Elected Officials (Volume 5, July 1975), p. vii.

 $^{^{7}}$ Between January 1976 and April 1978, 12 Black Federal judges were appointed by the President.

Forty percent of these appointments were to U.S. Federal courts (table 111).

ARMED FORCES

Historical records indicate that significant numbers of Blacks have served in the major wars in which this country has been engaged. It has been estimated that 5,000 Blacks, both slave and free, served in the Revolutionary War. At the beginning of World War I, about 10,000 Blacks were serving in each of the services—the Army and the National Guard.⁸

Statistics on Blacks in the military have become available from the Department of Defense (previously the War Department) on a fairly regular basis only within recent decades. The earliest data published in The American Negro Reference Book are for the World War II period; table 112 shows that 468,000 Blacks were in the Army as of December 1942.

In 1949, 107,000 Black men and women were serving in the Armed Forces. By 1975, the number of Blacks in the Armed Forces had almost tripled to 302,000, equaling the previous high which occurred in 1967 during the Vietnam War (table 113).

In 1949, Blacks represented 7 percent of all the military forces. This proportion rose to 9 percent in 1967. The increase in the proportion of Blacks in the Armed Forces has been especially marked since 1970, rising from 10 percent in 1970 to 14 percent in 1975, and can be attributed to a substantial decline in the total Armed Forces accompanied by a growth in Black personnel (table 114). The growth has been partly the result of the increasing number of Blacks who have enlisted (or reenlisted) in the Armed Forces since the volunteer system was instituted in December 1972. In 1972, the 60,000 Black enlistees constituted 15 percent of all persons who enlisted for the first time (those with no prior service). In 1975, 73,000 Blacks were first enlistees, comprising 18 percent of those enlisted (table 116).

The substantial number of Blacks volunteering for the Armed Forces in the 1970's may be the result of people seeking upward mobility or employment because of the high unemployment levels in the civilian labor force. Black enlistees tended to have educational levels which were similar to their White counterparts. For example, in 1975, approxi-

mately two-thirds of both Black and White enlistees were high school graduates (table 116).

From 1949 to 1975, the majority of Blacks in the military served in the Army. In 1949, 62 percent of the Blacks in the Armed Forces were in the Army; in 1975, the 155,000 Black Army personnel comprised just over one-half of the total Black Armed Forces.

Since 1949, almost all Blacks in the military have been enlisted personnel. In 1975, 293,000 of the 302,000 Black military were enlisted. This pattern, was true regardless of the branch of the service (table 113).

From 1949 to 1975, the proportion of all enlisted personnel who were Black doubled from 7 percent to 16 percent (table 114).

The number of Black officers grew from 2,000 in 1949 to 9,000 in 1975. Although the number of Black officers had increased four-fold, they continued to comprise only a very small proportion of all officers in the Armed Services, moving from about 1 percent in 1949 to 3 percent in 1975 (table 113). As of March 1975, 19 of the approximately 9,000 Black officers held top-ranking positions (general or admiral) in three branches of the Armed Forces—Army, Navy, and Air Force.

Black women represented 9 percent of all women serving in the military in 1966, as compared with almost 16 percent in 1975. Since 1970, the number of Black women service personnel has more than tripled from about 5,000 to 15,000. Like all Black service personnel, Black women have been concentrated in the Army. Black women represented 5 percent of all women officers in 1975, and 17 percent of all women enlisted personnel (table 115).

In 1964, the Black reenlistment rate in the Armed Forces was substantially higher than that for Whites—31 percent versus 17 percent. From 1964 to 1970, there was a pronounced decline in the reenlistment rate for Black servicemen who were eligible to reenlist, bringing the Black reenlistment rate closer to that of Whites; the rates were 13 percent in 1970 for Blacks as compared with 9 percent for Whites. Between 1970 and 1975, the rates had risen for both Blacks and Whites. However, in 1975, the reenlistment rate for Blacks was again substantially higher than that for Whites—51 percent versus 35 percent (table 117).

⁸ John Hope Franklin, From Slavery to Freedom, (New York: Alfred A. Knopf, 1956), pp. 135 and 447.

⁹In March 1978, there were 23 Black top-ranking officers; figures are from the Department of Defense.

Selected Social Characteristics of the Population

SOURCE: Tables 120, 123, and 125.

IX. Social Characteristics

The data in this chapter generally cover the years 1975, 1976, and 1977. However, figures for 1978, which recently became available, have been included in many of the tables in this section.

POPULATION GROWTH AND DISTRIBUTION

The Black resident population was 25.4 million on April 1, 1978, representing an increase of 1 million over the 1975 figure. The average annual rate of change between 1975 and 1978 was 1.4 percent—close to that characterizing the first half of the 1970 decade. In 1978, Blacks represented 12 percent of the total population (table 118).

In the 1970's, the migration pattern of the Black population changed considerably from the dominant pattern of earlier decades, when there was large net outmigration of Blacks from the South and large net inmigration of Blacks to the North. Recent migration statistics for the 1975-78 period show that the Northeast region had a net outmigration of Blacks and that the number of Blacks moving to the North Central region was not significantly different from the number of Blacks moving from the region. The West continued the pattern of the 1960 decade with a net inmigration of Blacks.

The large net outmigration of Blacks from the South has diminished in the 1970's; from 1975 to 1978, the number of Blacks who left the South—244,000—was not significantly different from the 270,000 who moved to that region (table 121).

In 1978, about three-fourths of the Black population resided in metropolitan areas, and more than one-half of all Blacks (55 percent) lived in central cities within these areas. One out of five Blacks in the United States lived in the suburbs of metropolitan areas.

The Black population in central cities did not increase from 1975 to 1978, indicating at least a temporary end to the pronounced growth in the number of Blacks in central cities that has characterized the past several decades.

Although the number of Blacks living in suburbs increased by 20 percent between 1975 and 1978, suburban Blacks represented only 26 percent of the Black metropolitan population (table 120).

EDUCATION

Black adults have been making educational gains, but still lag behind their White counterparts. For example, in 1977, about 21 percent of Black men and women 18 to 24 years old were enrolled in college as compared with approximately 27 percent for White young adults. The proportion of Blacks enrolled in college remained stable between 1976 and 1977 but was higher than the 1970 level (shown in table 66 of Part One) (table 123).

In 1978, about 1 out of 10 Black men and women 25 to 34 years old had completed 4 or more years of college as compared with 1 out of 4 White men and women in this age group (table 124).

FAMILY

In 1978, there were 5.8 million Black families. The period from 1975 to 1978, like the first half of the 1970 decade, (shown in table 74 of Part One) has been characterized by a rise in the proportion of Black families maintained by women, with no husband present and a corresponding decline in the proportion of Black husband-wife families. Between 1975 and 1978, Black husband-wife families declined from 61 percent to 56 percent of all Black families, while the proportion of women with no husband present maintaining families increased from 35 percent to 39 percent (table 125).

About 49 percent of all own Black children under 18 years of age lived with two parents in 1978, a decline from 54 percent in 1975. The comparable proportion for White children showed a slight drop to 86 percent for the 3-year period (table 128).

VOTING AND REGISTRATION

Forty-nine percent of the Black American electorate reported that they voted in the Presidential election of 1976. This turnout was 3 percentage points lower than the voter-participation rate in the 1972 Presidential election. (Figures for 1972 are provided in table 104 of Part One.) A similar decline in voter participation was noted for Whites.

The declines in voter turnout between the 1972 and 1976 elections were accompanied by a decline in the proportion registered for both Blacks and Whites. Although the proportions registered dropped between 1972 and 1976, registra-

A further discussion of recent migration patterns for both Blacks and Whites is presented in Current Population Reports, Series P-20, No. 331, "Geographical Mobility: March 1975 to March 1978."

tion levels for Blacks remained unchanged while those for Whites showed some evidence of a decline (table 130).

ELECTED OFFICIALS

The number of Blacks elected to public office has continued the growth which began in the mid-1960's. In July 1977, 4,311 Blacks were holding office, representing an 8-percent increase over the 1976 figure of 3,979. Among the States, the largest number of Black officeholders, in rank order, were found in Mississippi, Illinois, and Louisiana (tables 131)

and 132).

In 1977, the majority (about 60 percent) of Black office-holders were in the South. Between June 1976 and July 1977, a number of Southern municipalities changed their process of electing council members from at-large elections to ward or district elections. Thus, some of these States, including Mississippi, experienced substantial increases in the number of Black elected officials in 1977 (table 132).²

rRevised.

NOTE: In processing the data collected in the March 1976 Current Population Survey, the Bureau of the Census utilized a new computer processing system designed to take maximum advantage of the Bureau's expanded computer capabilities. The revised system incorporates many improvements in the procedures used to process the data. In addition to the 1976 and 1977 data, selected tables in Part Two of this report present revised 1975 data (notated with "r") resulting from the changes in processing. Therefore, in some instances, 1975 figures may vary from those shown in Part One.

X. Economic Characteristics

INCOME AND POVERTY STATUS

Since 1974, the generally sluggish economy and inflationary pressures have had an effect upon the income levels and poverty status of both Blacks and Whites. There was a slight increase in real median income between 1974 and 1977 for White families, but no improvement for Black families. During the same period, there was an increase in the number of poor Blacks, while the apparent increase of White persons in poverty was not statistically significant. The following discussion presents some limited comparisons for the 1976-77 period, and a more detailed analysis of changes since 1974.

The majority of the data in this section of the chapter have been adjusted for inflation and are shown in terms of 1976 constant dollars. In order to provide the most current information, we have presented 1977 income data from the March 1978 Current Population Survey (which recently became available) in tables 133, 134, 146, appendix tables A-25 and A-26, and in the textual analysis. Thus, the following discussion (with the exception of Regional Variations—Young Husband-Wife Families) presents a detailed analysis of changes since 1974 in terms of 1977 constant dollars.

Changes in Income of Families: 1974 to 1977

The 1977 median income of Black families was \$9,560, not significantly different in real terms than their 1976 median. White families had a median income of \$16,740 in 1977, about 1 percent higher, after adjustment for inflation, than in 1976.

Between 1974 and 1977, the real median income of Black families did not change significantly. However, real median income of White families increased 2 percent during this period, from \$16,480 to \$16,740. Because the median income of White families increased while that of Black families remained unchanged, Black median income as a percent of White median income declined from 60 percent in 1974 to 57 percent in 1977. Changing family structure had some impact on this overall differential as indicated by the following. There is some evidence that Black husband-wife families experienced a 4-percent increase in real median income (from \$13,150 in 1974 to \$13,720 in 1977). In contrast, the 1977

median income of Black families with a female head, no husband present, (\$5,600) was not significantly different from its 1974 level (tables 134 and A-25).

In 1977, about 30 percent of the 5.8 million Black families had incomes of \$15,000 and over. In contrast, 57 percent of all White families had incomes of \$15,000 and over in 1977. For both Black and White families, the 1977 income distribution approximated the 1974 distribution in constant dollars (table 133).

Median family income varied by region of residence. The 1977 median was lower in the South than in the North and West for both Black and White families. The median income of families living in the South has been consistently lower than in the North and West, but the gap has been narrowing. Between 1974 and 1977, median income of Black families in the South increased by 7 percent (from \$8,400 to \$8,960), while the median income of Black families living in the North and West declined by 12 percent (from \$11,790 to \$10,400). Median income of Southern White families increased 5 percent between 1974 and 1977 (from \$14,950 to \$15,720) while there was not a significant change over the period in the median of White families in the North and West (\$17,200 in 1977) (table A-25).

Regional Variations—Young Husband-Wife Families¹

As noted in Part One of this report, within recent years significant advances have been made in closing the Black-White income gap by young Black husband-wife families (husband under 35 years old). In the North and West, young Black husband-wife families in which both spouses were earners achieved and maintained incomes equal to those of their White counterparts. Although the comparable group of Black families in the South had not yet obtained the income parity exhibited in the North and West, they did make significant advances in closing the Black-White income gap. The 1976 figures show that this relationship continued in both the North and West and the South. In the North

¹ These data cover the period up through calendar year 1976; they do not reflect the income levels of 1977.

and West in 1976, the Black to White median income ratio for these young families was 100 percent, indicating that parity continues to be exhibited between these Black and White families.

An important part of the explanation of the narrowing gap between Black and White income is the working wife. In 1976, as was evident in the past, Black wives were more likely than White wives in both the North and West and the South to have participated in the employed labor force and as year-round workers. In the North and West, a larger percentage of young Black wives worked year round—45 percent compared to 33 percent for their White counterparts (table 144).

Changes in Income of Persons: 1974 to 1977

The median income of Black male income recipients in 1977 was \$6,290 compared with \$10,600 for White males. In 1977, the real median incomes of both these groups were lower than their respective 1974 medians, \$6,740 and \$10,880. For year-round full-time workers, there was no statistically significant difference in the 1977 median income for either Black men (\$10,600) or White men (\$15,380) when compared with their 1974 medians.

In 1977, the median income of Black women with income was \$3,460 compared with \$4,000 for White women. Black women who worked year round full time in 1977 had a median income of \$8,290, whereas the median for the comparable White workers was \$8,870. Neither of these figures was significantly different from their 1974 levels. Between 1974 and 1977, the median income for all White women increased 4 percent, while the median for Black women remained unchanged. It should also be noted that the Black-to-White median income ratio for women (86 percent) is considerably higher than the ratio for men (59 percent) (table A-26).

Changes in Poverty: 1974 to 1977

There were 7.7 million Blacks and 16.4 million Whites below the poverty level in 1977. These figures were not significantly different from those of 1976. However, between 1974 and 1977, the number of poor Blacks rose by over half a million, with most of the increase taking place between 1974 and 1975. Whites also experienced a large increase in poverty during that year (1974-75) but this rise was followed by a decline of 1.4 million over the next 2 years (1975-77). As a result, the number of Whites below the poverty level in 1977 was not significantly different from the 1974 figure. In 1977, as in previous years, the poverty rate was much higher for Blacks (31 percent) than for Whites (9 percent) (tables 146 and 147).

About 1.6 million Black families and 3.5 million White families were below the poverty level in 1977, approximately the same as in the previous year. Between 1974 and 1976, both Black and White families experienced increases in poverty. At the same time, the number of poor unrelated individuals of both races also increased. Between 1976 and

1977, the number of White unrelated individuals in poverty dropped slightly, while the number of poor Black unrelated individuals remained unchanged. Black unrelated individuals did, however, experience a significant decline in the poverty rate during this period, from 40 percent to 37 percent.

Since 1974, there is some evidence that the proportion of poor Black families with a female head, no husband present, increased slightly from 68 percent to 71 percent. Throughout the 1974-77 period, the poverty rate for Black families maintained by women was almost four times the rate for those maintained by men; in 1977, the poverty rates for these two groups were 51 percent and 13 percent, respectively (tables 146 and 148).

LABOR FORCE, EMPLOYMENT, AND OCCUPATION

The economic recovery and growth experienced by the Nation since the 1973-75 recession, have not been shared fully by the Black population. Since 1975, Blacks have made gains in the number of employed; however, Black unemployment levels have remained essentially unchanged. Although the Black jobless rate was lower in mid-1978 than it was at the beginning of 1975, it still remained relatively high. Among Whites, employment has risen and both unemployment levels and rates were substantially reduced during the period of economic recovery and growth.

In this part of the chapter, the term "Black" is used throughout the text although the data may be for "Black and other races." However, in one section—Unemployment Rates—distinctions are noted between unemployment rates of Black and other races and Blacks. In that particular text, the quarterly averages are presented for Black and other races whereas annual average data are for Blacks exclusively.

Labor Force Developments

In 1977, the civilian labor force averaged 11.3 million persons for Blacks and 86.1 million persons for Whites. During the 2-year period ending in 1977, the Black civilian labor force grew more rapidly than its White counterpart (7.3 percent compared with 4.9 percent). On the other hand, between 1975 and 1977, Black employment increased from 9.1 million to 9.8 million, and White employment increased from 75.7 million to 80.7 million.

Although nearly three-quarters of a million Blacks obtained new jobs from 1975 to 1977, the number of Blacks who were unemployed remained essentially the same, at about 1.5 million. During the same period, White unemployment decreased markedly by about 1 million persons (table 156).

According to the 1978 edition of the Employment and Training Report of the President, the development noted above for Black workers, i.e., increased employment coupled with no declines in unemployment, "may indicate that many Blacks who had previously been outside the labor force were encouraged about their job prospects in light of the

strong economic recovery. This rise in employment expectations may have attracted more workers into the labor market than could be accommodated with jobs."²

Unemployment Rates

From 1975 to 1977, the jobless rate for Blacks declined slightly from 14.7 percent to the still rather high rate of 13.9 percent. In contrast, the rate declined substantially for Whites, falling from 7.8 percent in 1975 to 6.2 percent in 1977 (table 154).

During the 1975-77 period, the quarterly jobless rate for Black and other races remained high, whereas the rates for Whites peaked in the recessionary second quarter of 1975. Between the last quarter of 1977 and the second quarter of 1978, the unemployment rate for Black and other races went down substantially from 13.3 percent to 12.0 percent. The rate for Whites also fell during the same period, from 5.8 percent to 5.1 percent.

The jobless-rate differentials between Blacks and Whites have widened since 1975. In that year, the Black rate was 1.9 times the White rate (relative to their proportion of the labor force, 1.9 Black workers were unemployed for every unemployed White worker). In 1977, the Black rate was 2.2 times the White rate, a substantial increase over the 1975 ratio. By mid-1978, the Black-and-other-races unemployment rate was 2.4 times the White rate—the widest gap between the two groups since the Federal government began recording employment statistics by race (table 154).

Some of the reasons noted for the widening disparity in unemployment rates between Blacks and Whites include: The recent surge of more Black workers into the labor market than could be absorbed; the greater proportions of Black than White workers in lower skilled, lower paying jobs, which are characterized by high turnover and greater incidence of unemployment; and racial discrimination.³

With the exception of Black women, unemployment among all segments of the Black and White adult populations has generally shown some improvement since 1975. However, the Black-to-White ratio of the jobless rate for both men and women has worsened. During the 2-year period 1975 to 1977, the jobless rate for adult men fell for Blacks and Whites by about 2 percentage points. In 1977, however, the rate for Black adult men was 10.5 percent, or about 2.3 times the rate of their White counterparts. From 1975 to 1977, joblessness for Black adult women showed no improve-

³ Ibid, p. 27.

ment and remained around 12 percent, whereas unemployment among White adult women declined (table 154).

Between the fourth quarter of 1977 and the second quarter of 1978, the unemployment rate for Black-and-other-races adult men dropped, whereas the rate for Black-and-other-races women remained at about the same level; in mid-1978, the unemployment rates were 8.5 and 10.9 percent, respectively.

Between 1975 and 1977, the jobless situation for Black teenagers did not improve. During this period, the rate for Black teenagers was approximately 40 percent. In contrast, White teenage joblessness went down from 17.9 percent to 15.4 percent (table 154). Nevertheless, among both Black and White teenagers, new entrants to the labor force comprised 70 percent of those who were unemployed in 1977.4

In the second quarter of 1978, the Black-and-otherraces teenage jobless rate was 36.9 percent, about the same as the high rate of 38.3 percent observed in the fourth quarter of 1977.

The Black-to-White unemployment ratio for teenagers continues to be the greatest among all major demographic groups. The Black-to-White ratio for youths was 2.2 in 1975 and reached 2.7 in 1977 (table 154).

In 1977, unemployment rates for Blacks varied substantially by occupation and industry of last job. Among the major occupation groups, managers and professionals had one of the lowest jobless rates in 1977. In contrast, the jobless rates for both Black men and women among several occupation groups were at or above 9 percent (i.e., sales, clerical, operatives, except transport, nonfarm laborers, and service workers, excluding private household). Among the major industry groups, unemployment rates ranged from about 4 percent to 22 percent for both Black men and women (tables 160 and 161).

Occupation

In 1977, the proportion of Black men and women employed in white-collar jobs (professional, managerial, sales, and clerical occupations) were 23 and 44 percent, respectively. The majority (58 percent) of Black men were found in blue-collar jobs. More than one-third (37 percent) of Black women held jobs as service workers.

Blacks continued to lag behind Whites in the proportion holding high-paying, high-status jobs. For example in 1977, Black women constituted about 11 percent of all employed women, but held only 7 percent of the white-collar positions (table 164).

¹Includes heads with wife present or without wife present.

NOTE: The Index of Income Overlap of White and Black is a statistical measure which summarizes the degree of overlap between the distributions and is equal to 1.00 when the two distributions are identical. Specifically, the index, which was computed on the basis of detailed income intervals, measures the sum of the commonalities expressed in terms of percents shared between Whites and Blacks for each income class interval. For a more detailed explanation of Index of Income Overlap, see Bureau of the Census, Technical Paper No. 22, "Measures of Overlap of Income Distribution of White and Black Families in the United States."

r Revised.

NOTE: In processing the data collected in the March 1976 Current Population Survey, the Bureau of the Census utilized a new computer processing system designed to take maximum advantage of the Bureau's expanded computer capabilities. In addition to the 1975 and 1976 data on income and poverty, selected tables in Part Two of this report also present revised data for 1974 (notated with "r") resulting from changes in processing. The revised system incorporates many improvements in the procedures used to process the data. For a more detailed explanation of these improvements and the subsequent revisions to the 1974 income and poverty data, see Bureau of the Census, Current Population Reports, Series P-60, Nos. 105 and 107.

¹ Includes heads with wife present or without wife present.

NOTE: The poverty threshold for a nonfarm family of four was \$6,191 in 1977. Families and unrelated individuals are classified as being above or below the poverty threshold, using the poverty index adopted by a Federal Interagency Committee in 1969. This index centers around the U.S. Department of Agriculture's Economy Food Plan and reflects the differing consumption requirements of families based on their size and composition, sex and age of the family head, and farm-nonfarm residence. The low-income cutoffs for farm families have been set at 85 percent of the nonfarm levels. These cutoffs are updated every year to reflect the changes in the Consumer Price Index. The poverty data exclude inmates of institutions, members of Armed Forces living in barracks, and unrelated individuals under 14 years of age. For a more detailed explanation, see Current Population Reports, Series P-60, No. 115.

rRevised.

NOTE: The poverty threshold for a nonfarm family of four was \$5,815 in 1976, \$5,500 in 1975, and \$5,038 in 1974. Families and unrelated individuals are classified as being above or below the poverty threshold using the poverty index adopted by a Federal Interagency Committee in 1969. This index centers around the Department of Agriculture's Economy Food Plan and reflects the differing consumption requirements of families based on their size and composition, sex and age of family head, and farm-nonfarm residence. The low-income cutoffs for farm families have been set at 85 percent of the nonfarm levels. These cutoffs are updated every year to reflect the changes in the Consumer Price Index. The poverty data exclude inmates of institutions, members of Armed Forces living in barracks, and unrelated individuals under 14 years of age. For a more detailed explanation, see Bureau of the Census, Current Population Reports, Series P-60, No. 115.

NOTE: Poverty areas in metropolitan areas are defined in terms of census tracts and in nonmetropolitan areas in terms of minor civil divisions (townships, districts, etc.) in which 20 percent or more of the population was below the poverty level in 1969. For a more detailed discussion of the low-income population residing in poverty areas, see Bureau of the Census, Current Population Reports, Series P-60, No. 106.

Appendix C

SOURCE AND RELIABILITY OF THE DATA

Most of the estimates in this report are based on dark ob-tained from the Currier Population Survey and December Consults conducted by the Baresia of the Centual Drop-data wire provided by private concerns and vanious gover-mence agencies involuding the Survius of Labor Stantion Success Century for Health Statistics, and the December of Determe. A comprise list of sources is indicent in Appendix A. "References for Tables."

menty with spor force data for the division non-interactional population. Questions relating to labor force participation are saudic every month about each member 14 years oid and older in each sample foundhold. In addition, subplementary

questions are asked in most months about serious about soon interactivation.

The present OPS sample was instally serioded from the 1970 cansus file and a supparted concursation to instead necessariation where bossible lake section. "Someoning Variability." below: The florithy IOS seriod is approach only a seriod of the 195 States and the Destrict of Columbia. A supplementary sample of housing units in 24 States and the Destrict of Columbia was recomposed with the monthly OPS sample to produce the 1974 and 1978 data. The seas-and/or OPS sample is cased in 614 area comprising 1,113 countes, independent ones, and divisions in the faction. The 614 states are also indused 463 areas from the monthly OPS and 153 supplementary state.

Press.

The following table provides a description of some apieco of the OPS sample designs in use during the reference data collection periods.

Description of the Current Population Survey

	Sumber of	Eouseholds	eligible	Sousing units
Time period	sample areas ¹	Interviewed	Sot intersiemed	visited, not eligible ³
Aug 1972 to present	461	45,000	2,000	8,000
Supplemental sample	253	8,500	500	1,500
Aug. 1971 to July 1972	449	45,000	2.000	8.000
Jan. 1967 to July 1971	449	₩£, 000	2 000	8,000
mar. 1963 to Dec. 1966	337	33,500	1 500	6,000
Jam. 1960 to Feb. 1963	3333	33 500	1,500	6.000
may 1956 to Dec. 1959	330	33,500	1.500	6,000
Feb. 1954 to Apr. 1956	230	21,300	505-1,000	3,000-3,50
Aug 194° to Jan. 1954	68	21,000	500-1 000	3, 300-3, 50

NOTE: Prior to 1966 income data were collected from approximately 73 percent of occupied households in CPS

*Beginning in May 1936, these areas were chosen to provide coverage is each State and the District of Columbia.
*These are households which were visited, but were found to be vacant or otherwise not eligible for interviee.
*Three sample areas were acceed in 1962 to represent Alassa and Bawaii after statehood.

Appendix B

DEFINITIONS AND EXPLANATIONS

Most of the statistics in this report are from the Bureau of the Census; remaining data are from other governmental and private sources. The Census Bureau statistics in Part One, "Historical Trends: 1790 to 1975," are compiled primarily from two sources—decennial censuses and Current Population Surveys (CPS). Other sources of Census Bureau data presented in Part One are the Censuses of Agriculture, the Surveys of Minority-Owned Businesses, and the Annual Housing Survey. Nearly all of the data from the Census Bureau presented in Part Two, "Recent Trends: 1975 to 1978," are based on the CPS. Specific sources for each table are given in Appendix A "References for Tables."

Decennial censuses. Beginning with the first census in 1790, data on the Black population have been collected and published for each decennial census. The amount of detail published for the Black population has varied over the decades; statistics from the earlier censuses are limited. The enumeration procedures, subjects covered, concepts and definitions have also changed over time. Major changes in concepts and definitions which affect the comparability of data over time are noted in several ways: in the tables, in the text, and in this section.

The data obtained from the decennial censuses are not entirely comparable to CPS data because of differing enumeration procedures and processing techniques.

Current population surveys. Changes which have occurred in the data collection procedures for the Current Population Surveys since 1948 have had an effect on data comparability over time. Also, population bases, population covered, the sample size, and processing techniques for the surveys have been revised periodically. Only the recent major changes are discussed here. For instance, beginning with the March 1975 CPS, the Bureau of the Census utilized a new computer processing system designed to take maximum advantage of the Bureau's expanded computer capabilities. The revised system incorporates many improvements in the procedures used to process the data; the new system has had more impact upon the income and poverty measures than on other characteristics. Therefore, data beginning with the March 1975 CPS shown in Part Two are not entirely comparable to

the CPS data presented in Part One. The 1975 data have also been processed by the old system and are shown in Part One.

Another modification affects CPS data from March 1973 through March 1978. Starting in January 1972, 1970 census-based population controls, metropolitan residence definitions, and other materials were introduced into the sampling and estimation procedures. The major item affecting comparability at the national level is the introduction of population controls based on the 1970 census. Figures for previous years, except where noted, are tied in with 1960-based population controls. Basically, these changes have no substantial impact on summary measures, such as medians and means, and on proportional measures, such as percent distributions. However, the changes may have more impact on the population levels in different subgroupings or within some particular category. Specific instances in the tables of this report are footnoted accordingly. A detailed description of the changes appears in the Bureau of Labor Statistics report, Employment and Earnings, Vol. 18, No. 8.

Another change in the CPS, beginning December 1971, which affects occupational data only, is the inclusion of a supplemental question, "What were your most important activities or duties?", which provided additional information for classifying persons by occupation. Additionally, changes in the occupational classification for the 1970 Census of Population were introduced in the Current Population Survey in January 1971. For a further explanation of these changes see Bureau of the Census, Technical Paper No. 26, "1970 Occupation and Industry Classification Systems in Terms of Their 1960 Occupation and Industry Elements," and Bureau of Labor Statistics, Employment and Earnings, Volume 17, No. 8 and Volume 18, No. 8.

Vital statistics. Data on mortality, from the U.S. Department of Health, Education, and Welfare, are from actual death records and cover all reported deaths in the United States. Prior to 1930, data were from death registration States only. In 1920, 34 States reported and in 1900, 10 States reported.

Birth statistics have been collected since 1915. At that time, the national birth-registration area included 10 States and the District of Columbia. Since 1933, the birth registration areas have comprised the entire United States, with Alaska included beginning in 1959 and Hawaii beginning in 1960. Prior to 1951, birth statistics were the result of a

complete count of records received by the Public Health Service. Since 1951, they have been based on a 50-percent sample of all registered births (except for 1955 when they reverted to a complete count and for 1967 when they were based on a 20-50 percent sample).

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns and cities rather than counties. The metropolitan population in this report, except where noted, is based on SMSA's as defined in the 1970 census and does not include any subsequent additions or changes.

Geographic regions. The standard census definition is used for the four regions of the country. They represent groups of States as follows:

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

North and West: This designation refers to the Northeast, North Central, and West regions combined.

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

North Central: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

West: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

A map outlining the four regions is shown in figure 1.

Income. Data on income covers money income only, prior to deduction for taxes, received from such sources as wages or salaries, net income from self-employment, Social Security, dividends, interest, public assistance and welfare, unemployment compensation, government pensions, and veterans payments. (Certain money receipts such as capital gains are not included.) Therefore, money income does not reflect the fact that many families receive part of their income in the form of nonmoney transfers such as food stamps, health benefits, and subsidized housing; that many farm families received

nonmoney income in the form of rent-free housing and goods produced and consumed on the farm; or that nonmoney incomes are also received by some nonfarm residents which often take the form of the use of business transportation and facilities, full or partial payments by business for retirement programs, medical and educational expenses, etc. These elements should be considered when comparing income levels. For a more detailed explanation, see Current Population Reports, Series P-60, Nos. 114 and 115.

Median income. The median income is the amount which divides the distribution into two equal groups, one having incomes above the median and the other having incomes below the median. The medians for families and individuals are based on all families and individuals. The median for persons is based on the distribution of persons with income.

Mean income. The mean income is the amount obtained by dividing the total income of a group by the number of units in that group (families, unrelated individuals, or persons). The means for families are based on all families. The means for persons are based on the number of persons with income.

Computation of constant dollars. The adjustment for price changes was made by converting the income distribution for families for each year (1947 to 1974) shown in Part One into 1974 dollars, and each year (1974 to 1977) presented in Part Two into 1976 and/or 1977 dollars on the basis of the change in the Consumer Price Index. The Consumer Price Index is basically a measure of changes in prices of the goods and services bought by urban "wage earner and clerical worker families" representing about three-fifths of all persons living in urban places and about two-fifths of the total U.S. population. The same index was used for all groups of families because separate price indices have not been developed for families in different income class intervals. In addition, available data did not permit adjustment for the fact that the price index is strictly applicable to consumer expenditures for goods and services, whereas the family income data also cover family savings and income tax payments. For these and other reasons, the constant dollar figures, particularly in the income range over \$10,000, are to be regarded as approximations. For a more detailed explanation, see Current Population Reports, Series P-60. No. 114.

Poverty classification. Families and unrelated individuals are classified as being above or below the poverty level using the poverty index adopted by a Federal Interagency Committee in 1969. This index centers around the U.S. Department of Agriculture's Economy Food Plan and reflects the differing consumption requirements of families based on their size and composition, sex, and age of the person maintaining the family, and farm-nonfarm residence. These poverty thresholds are updated every year to reflect the changes in

the Consumer Price Index. The poverty threshold for a nonfarm family of four was \$6,191 in 1977, \$5,815 in 1976, and \$2,973 in 1959. The poverty data exclude inmates of institutions, members of Armed Forces living in barracks, and unrelated individuals under 14 years of age. For a more detailed explanation, see Current Population Reports, Series P-60, No. 115.

Labor force and employment status. Information on labor force and employment status generally relate to the population 10 years old and over for 1890 to 1930, 14 years old and over for 1940 to 1960, and 16 years old and over for 1970 to 1978. (Some 1970 data are for those 14 years and over and are so noted in the tables.)

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labormanagement dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who had no employment during the survey week but were available for work and (1) had engaged in any specific jobseeking activity within the past 4 weeks; (2) were waiting to be called back to a job from which they had been laid off, or (3) were waiting to report to a new wage or salary job scheduled to start within the following 30 days.

Labor force. Persons are classified as being in the labor force if they were employed, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is composed of all civilians classified as employed or unemployed. Labor force data beginning with the 1940 census are not entirely comparable with those gathered from 1890 to 1930, which pertains to gainful workers. The concept "gainful worker" included all persons who usually followed a gainful occupation, although they may not have been employed at the time the census was taken. It did not include women doing housework in their own home without wages and having no employment, or children working in the home at general household work, chores, or at odd times at other work.

Not in the labor force. All civilians who are not classified as employed or unemployed are defined as "not in the labor force." This group of persons who are neither employed nor

seeking work includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work; seasonal workers for whom the survey week fell in an off season; and the voluntarily idle. Persons doing less than 15 hours unpaid family work are also classified as not in the labor force.

Occupation and industry. The CPS data on occupation and industry shown in Part Two are not comparable with the census data in Part One. Even within Part One, fundamental differences between the censuses, on occupation and industry information, limit the comparability of the data from one census to another. First, occupation and industry information for the censuses of 1890, 1910, and 1930 cannot be compared with that collected in 1940 and subsequent censuses. Prior to 1940, as noted above, under labor force, the census data on the economically active population referred to gainful workers; subsequent censuses refer to the experienced labor force. In addition, the occupational classification system used in the 1940's and later years is quite different from that used earlier. The following three major changes affect the comparability of data for the more recent censuses (1940 to 1970):

- a. The age coverage for statistics on these subjects in 1940 and 1960 include persons 14 years old and over, in accordance with the definition of the labor force at those times; whereas most of the 1970 statistics are shown for persons 16 years old and over to agree with the current definitions of the labor force. However, for comparability, the 1970 data for the United States shown in this report are for persons 14 years and over. The regional figures are for persons 16 years old and over.
- b. The allocation of "not reported" cases to the major occupation groups in 1970 increased the size of those totals relative to the totals for 1940 and 1960 when there was no allocation of these characteristics. The figures for persons 14 years old and over shown for 1970 have been adjusted such that the "not reported" category is treated according to the 1960 presentation. Such estimates were made at the national level only; regional distributions do not reflect these adjustments.
- c. Changes made in the classification system limit the comparability of the data from census-to-census. Between 1960 and 1970, the number of categories was greatly increased and a new major group, "transport equipment operatives," was added to the occupation classification. Adjustments have been made in the 1960 data at the national level only to achieve as close comparability with the 1970 classification system as possible, which are shown in 1970 census reports.

Most of the adjustments outlined above under the three areas have been published in selected tables of the 1970 census reports, Volume I, Characteristics of the Population. However, adjustments made in the data for Blacks were prepared especially for this report. For more detailed

information on the differences and various factors affecting the comparability in the occupation and industry data see the discussion and publications cited in the 1970 census reports, Volume I, Characteristics of the Population, Appendix B.

Occupation divisions. The major occupation groups are combined into four divisions, as follows:

White-collar workers. Professional, technical, and kindred workers; managers and administrators, except farm; sales workers; and clerical and kindred workers.

Blue-collar workers. Craft and kindred workers; operatives, except transport; transport equipment operatives; and laborers, except farm.

Farm workers. Farmers and farm managers; and farm laborers and supervisors.

Service workers. Private household workers and other service workers.

The sequence in which these four divisions appear is not intended to imply that any division has a higher social or skill level than another.

Work experience. A person with work experience is one who, during the preceding calendar year, did any work for pay or profit or worked without pay on a family-operated farm or business at any time during the year, on a part-time or full-time basis.

Part-time or full-time jobs. A person is classified as having worked at part-time jobs during the preceding calendar year, if he or she worked at jobs which provided less than 35 hours of work per week in a majority of the weeks in which he or she worked during the year. The person is classified as having worked at full-time jobs if he or she worked 35 hours or more per week during a majority of the weeks in which he or she worked.

Year-round full-time worker. A year-round full-time worker is one who worked primarily at full-time civilian jobs (35 hours or more per week) for 50 weeks or more during the preceding calendar year.

Black-owned businesses. The three types (legal forms of organization) of entities covered in this report are:

- 1. Sole proprietorship-unincorporated business owned by one person. Also included in this category are self-employed individuals.
- 2. Partnership-unincorporated business owned by two or more persons, each of whom has a financial interest in the business.
- Corporation-business that is legally incorporated under State laws.

A firm was considered to be Black-owned if the sole

owner or more than half of the partners were Black. A corporation was classified as Black-owned if more than 50 percent of the stock was owned by Blacks.

Years of school completed. Information on educational attainment applies only to progress in "regular" schools and refers to the highest grade of school completed. Such schools include graded public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or a high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

The median years of school completed is defined as the value which divides the distribution into two equal groups, one having completed more schooling and one having completed less schooling than the median. These medians are expressed in terms of a continuous series of numbers representing years of school completed. For example, a median of 9.0 represents the completion of the first year of high school and a median of 13.0 means completion of the first year of college.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants. A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

The figures for number of households are not strictly comparable from year to year. In general, the definitions of household used in 1900, and from 1930 to 1975 are similar. Very minor differences result from the fact that in 1950, 1960, and 1970, housing units with 5 or more lodgers were excluded from the count of households, whereas in 1930 and 1940, housing units with 11 lodgers or more were excluded, and in 1900, no precise definition of the maximum allowable number of lodgers was made. The definition of household for 1890, 1910, and 1920 differs slightly from that given above. For these censuses, no distinction was made between households and group quarters (quasi-households), and thus the numbers include both households and group quarters.

Family. The term "family," as used in this report, refers to a group of two or more persons related by blood, marriage, or

adoption and residing together; all such persons are considered as members of one family. A household may contain more than one family. A person maintaining a household alone, or with unrelated persons only, is regarded as a household but not as a family. Thus, some households do not contain a family.

Data for families are shown only for 1940 and later years. Prior to 1940, the concept of "family" was basically synonymous with the present concept of "household" wherein a family comprised the head of a household and all other members of the household related to the head. Under this definition, a head of a household living alone was counted as a family but a mutually related group of lodgers or resident employees were not counted as a family. For further explanation concerning the historical comparability of the terms, see Bureau of the Census, Historical Statistics of the United States, Colonial Times to 1970, Bicentennal Edition, Part 1.

As noted earlier in the report, in the past, the Census Bureau designated a head of household to serve as the central reference person for the collection and tabulation of data for each member of the family (or household). However, the trend toward recognition of equal status of adult members of the family (or household) has made the term "head" increasingly inappropriate in the analysis of family and household data. Therefore, the terms "families maintained by a rnan" or "families maintained by a woman" are treated as synonymous with those of male head and female head used in previous reports.

Rounded numbers. Individual figures are generally rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers. In general, percentages which round to less than 0.5 are treated as zero.

More detailed definitions. Definitions and explanations for most subjects in the report are found in the decennial census reports and Current Population Survey reports, and in the specific sources listed in Appendix A, "References for Tables."

Appendix C

SOURCE AND RELIABILITY OF THE DATA

Source of Data

Most of the estimates in this report are based on data obtained from the Current Population Survey and Decennial Censuses conducted by the Bureau of the Census. Other data were provided by private concerns and various governmental agencies including the Bureau of Labor Statistics, National Center for Health Statistics, and the Department of Defense. A complete list of sources is shown in Appendix A, "References for Tables."

Current Population Survey (CPS). The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked every month about each member 14 years old and older in each sample household. In addition, supplementary

questions are asked in most months about various population characteristics.

The present CPS sample was initially selected from the 1970 census file and is updated continuously to reflect new construction where possible (see section, "Nonsampling Variability," below). The monthly CPS sample is spread over 461 areas with coverage in each of the 50 States and the District of Columbia. A supplementary sample of housing units in 24 States and the District of Columbia was incorporated with the monthly CPS sample to produce the 1977 and 1978 data. The expanded CPS sample is located in 614 areas comprising 1,113 counties, independent cities, and divisions in the Nation. The 614 sample areas used include 461 areas from the monthly CPS and 153 supplementary areas

The following table provides a description of some aspects of the CPS sample designs in use during the reference data collection periods.

Description of the Current Population Survey

	Number of	Households	Housing units		
Time period	sample areas ¹	Interviewed	Not interviewed	visited, not eligible ²	
Aug. 1972 to present	461 153 449 449 357 3333 330 230 68	45,000 8,500 45,000 48,000 33,500 33,500 21,000 21,000	2,000 500 2,000 2,000 1,500 1,500 1,500 500-1,000 500-1,000	8,000 1,500 8,000 8,000 6,000 6,000 3,000-3,500 3,000-3,500	

NOTE: Prior to 1966, income data were collected from approximately 75 percent of occupied households in CPS.

 $^{^{1}}$ Beginning in May 1956, these areas were chosen to provide coverage in each State and the District of Columbia.

²These are households which were visited, but were found to be vacant or otherwise not eligible for interview.

 $^{^3}$ Three sample areas were added in 1960 to represent Alaska and Hawaii after statehood.

The estimation procedure used for the monthly CPS data involves the inflation of weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race, and sex. These independent estimates are based on statistics from decennial censuses; statistics on births, deaths, immigration, and emigration; and statistics on the strength of the Armed Forces.

Decennial census of population. Decennial census data in this report are based on complete counts or on the samples associated with the census. Descriptions of samples from the census are found in the appropriate census publications. Some 1960 data footnoted in this report are from special tabulations of the 53,000 households in a 1-in-1,000 sample of the 1960 census. See Appendix A, "References for Tables" for the specific tables.

Annual Housing Survey. The Annual Housing Survey (AHS) data were collected in October through December 1975 by the Bureau of the Census, acting as a collection agent for the Department of Housing and Urban Development. The sample for this survey was spread over the same 461 PSU's used for CPS. Approximately 72,600 sample housing units (both occupied and vacant) were eligible for interview. Of this number, 3,700 interviews were not obtained because, for occupied housing units, the occupants were not found at home after repeated calls or were unavailable for some other reason, or, for vacant housing units, no informed respondent could be found after repeated visits. In addition to the 72,600, there were also 7,300 sample units which were visited but found not to produce information relevant to the 1975 housing vacancy inventory. The AHS estimation procedure was similar to the one used for CPS, except that independent estimates of housing units were employed for AHS.

Vital statistics data. Data on mortality rates are published by the Office of Health Statistics Analysis of the National Center for Health Statistics, U.S. Department of Health, Education, and Welfare. Data on number of deaths (numerators of death rates) are gathered from the offices of vital statistics of State governments, with the assistance of the Public Health Service. The denominators of death rates are decennial census figures by age, sex, and race, with adjustments.

Fertility statistics are of two types: fertility rates based jointly on vital statistics and census data (example: total fertility) and rates based on census and/or survey data alone. Children-ever-born statistics are of the second type as are birth expectations statistics and cumulated proportion by age of women having first birth.

Reliability of CPS Estimates

Since the CPS estimates in this report are based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same schedules, instructions, and enumerators. There are two

types of errors possible in an estimate based on a sample survey—sampling and nonsampling. The standard errors provided for this report primarily indicate the magnitude of the sampling errors. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of the nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Nonsampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness of respondents to provide correct information, inability to recall information, errors made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units within sample households (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage, as compared to the level of the decennial census, is about 5 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Black and other races than for Whites. Ratio estimation to independent age-sex-race population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age-sex-race group. Further, the independent population controls used have not been adjusted for undercoverage in the 1970 census, which was estimated at 2.5 percent of the population with similar undercoverage differentials by age, sex, and race as is observed in CPS.

The approximate magnitude of two sources of undercoverage of housing units is known. Of the 83,000,000 housing units in the U.S., about 600,000 new construction housing units other than mobile homes are not represented in the CPS sample because they were assigned building permits prior to January 1970, but building was not completed by the time of the census, (i.e., April 1970). Almost all conventional new construction, for which building permits were issued after 1969, is represented. About 290,000 occupied mobile homes are not represented in CPS; these units were either missed in the census or have been built or occupied since the census. These estimates of missed units are relevant to the present sample only and not to earlier designs where the extent of undercoverage was generally less. The extent of other sources of undercoverage of housing units is unknown but believed to be small.

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability,

that is, of the variations that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its estimated error enable one to construct confidence intervals, ranges that would include the census value for specified percentages of all the possible samples that could be obtained from the sample design used for this survey. The census value would be included in the range:

- i. From one standard error below to one standard error above the derived estimate for about 68 percent of all possible samples.
- ii. From 1.6 standard errors below to 1.6 standard errors above the derived estimate for 90 percent of all possible samples.
- iii. From two standard errors below to two standard errors above the derived estimate for 95 percent of all possible samples.

All statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase, "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

Comparability with other data. Data obtained from the CPS and other governmental sources are not entirely comparable. This is due in large part to differences in interviewer training and experience and in differing survey processes. This is an additional component of error not reflected in the standard error tables. Therefore, caution should be used in comparing results between these different sources.

Caution should also be used in comparing CPS estimates from 1977 and 1978, when the expanded sample was used, to those from 1976 and earlier years. Some relatively large differences in estimates of population in metropolitan and nonmetropolitan areas have been observed between the 461 and 614 area samples. These differences reflect a relatively large increase in variance on those estimates and do not represent actual changes in the population.

Note when using small estimates. Summary measures (such as averages and percent distributions) generated from CPS data are shown in the report only when the base of the measure is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's need.

Standard errors for data based on the CPS sample. Instructions on the use of and tables of standard errors for estimates

and percentages for characteristics pertaining to the total or White population (tables C-1 and C-3) and to Black and other races (tables C-2 and C-4) are presented below. Table C-5 presents factors which are to be applied to the figures in tables C-1 through C-4 to produce standard errors for the various subject matter areas.

Standard errors for data based on the 1960 census 1-in-1,000 sample. Standard errors for data based on the 1960 census 1-in-1,000 sample are estimated by applying the appropriate factor given in table C-5 to the standard errors shown in tables C-1 through C-4.

Standard errors for other data based on the decennial census. Sampling errors of all other data from the samples of the census shown in the report are small enough to be disregarded. However, the standard errors may be found in the appropriate Census volumes.

Standard errors for data based on vital statistics. Since sample statistics are not involved in the numerator or denominator of any vital rate (mortality or fertility), the standard errors for such rates are zero.

Standard error tables and their use. In order to derive standard errors that would be applicable to a large number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

Standard errors for intermediate values not shown in tables C-1 through C-4 may be approximated by linear interpolation. Estimated standard errors for specific characteristics cannot be obtained from these tables without the use of factors in table C-5. These factors must be applied to the generalized standard errors in order to adjust for the combined effect of sample design and estimating procedure on the value of the characteristic. For example, to produce approximate standard errors for total or White estimates for poverty persons based on data collected in the CPS after January 1967, multiply the appropriate figures in table C-1 or C-3 by the factor, 1.7. The factors for families and households should be used for items which can typically appear only once in a given household, e.g., "number of household heads" or "number of female household heads."

Two parameters (denoted "a" and "b") are used to calculate standard errors for each type of characteristic; they are presented in table C-6. These parameters were used to calculate the standard errors in tables C-1 through C-4 and to calculate the factors in table C-5. They also may be used to directly calculate the standard errors for estimated numbers and percentages. Methods for direct computation are given in the following sections.

Standard errors of estimated numbers. The approximate standard error, $\sigma_{\rm X}$, of an estimated number shown in this report can be obtained in two ways. It may be obtained by use of the formula

$$\sigma_{\mathbf{X}} = \mathbf{f}\sigma$$
 (1)

where f is the appropriate factor from table C-5, and σ is the standard error on the estimate obtained by interpolation from tables C-1 and C-2. Alternatively, standard errors may be approximated by formula (2), from which the standard errors were calculated in tables C-1 and C-2. Use of this formula will provide more accurate results than the use of formula (1) above.

$$\sigma_{X} = \sqrt{ax^{2} + bx}$$
 (2)

Here x is the size of the estimate and a and b are the parameters in table C-6 associated with the particular type of characteristic.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which the percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameter indicated by the numerator. The approximate standard error, $\sigma_{\{X,p\}}$, of an estimated percentage can be obtained by use of the formula

$$\sigma_{(X,D)} = f\sigma$$
 (3)

In this formula f is the appropriate factor from table C-5, and σ is the standard error on the estimate from tables C-3 or C-4. Alternatively, standard errors may be approximated by the following formula, (4), from which standard errors in tables C-3 and C-4 were calculated; direct computation will give more accurate results than use of the standard error tables and the factors.

$$\sigma_{(x,p)} = \sqrt{\frac{b}{x} p (100 - p)}$$
 (4)

Here x is the size of the subclass of persons, families, households, or householders which is the base of the percentage, p is the percentage (0 \leq p \leq 100), and b is the parameter in table C-6 associated with the particular type of characteristic in the numerator of the percentage.

Illustration of the use of standard errors. Table 143 of this report shows that there were 3,406,000 Black husband-wife families with earnings in 1976. Table C-2 shows the standard error on an estimate of this size to be approximately 83,000. Applying the appropriate factor from table C-5 and using formula (1), the approximate standard error is 0.6 x 83,000 = 50,000. The 68 percent confidence interval as shown by

these data is from 3,356,000 to 3,456,000. Therefore, a conclusion that the census value lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. Similarly, we could conclude that the census value lies within the interval from 3,306,000 to 3,506,000 (using twice the standard error) with 95 percent confidence.

Table 143 also shows that of this 3,406,000 Black husbandwife families with earnings, 55 percent reported both husband and wife as earners. Since the numerator of this percentage refers to the number of Black families with both husband and wife as earners then the b parameter from table C-6 is 922. Using formula (4) the standard error on an estimate of 55 percent is approximately

$$\sqrt{\frac{922}{3,406,000}} \text{ (55) } (100 - 55) = 0.8 \text{ percent}$$

Consequently, the 68 percent confidence interval is from 54.2 to 55.8 percent, and a conclusion that the census value lies within this range would be correct for roughly 68 percent of all possible samples. Similarly, we could conclude that the census value lies within the interval from 53.4 to 56.6 (using twice the standard error) with 95 percent confidence.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to

$$\sigma_{(X-Y)} = \sqrt{\sigma_X^2 + \sigma_Y^2}$$
 (5)

where $\sigma_{\rm X}$ and $\sigma_{\rm Y}$ are the standard errors of the estimates x and y; the estimates can be of numbers, percents, ratios, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.

Illustration of the computation of the standard error of a difference. Table 143 of this report also shows that 48 percent of the White husband-wife families with earnings in 1976 reported both husband and wife as earners in the household. Thus the apparent difference between the percent of White husband-wife earners and Black husband-wife earners in a household is 7 percent. Using formula (4) with base of 43,397,000 and the b parameter for total or White family income from table C-6, the standard error, $\sigma_{\rm X}$, on 48 percent is 0.2 percent. As shown above, the standard error, $\sigma_{\rm Y}$, on 55 percent is 0.8 percent. Therefore, using formula (5), the standard error of the estimated difference of 7 percent is about

$$\sqrt{(0.2)^2 + (0.8)^2} \doteq 0.8$$
 percent

¹ Formula (2) for this example gives a standard error of 49,000.

This means the 68 percent confidence interval around the difference is from 6.2 to 7.8 percent. Therefore, a conclusion that the difference from a complete census lies within this range would be correct for roughly 68 percent of all possible samples. Similarly, we could conclude that the difference from a census lies within the interval from 5.4 to 8.6 percent (using twice the standard error) with 95 percent confidence. Thus, we can conclude with 95 percent confidence that there were a larger percent of Black husband-wife families where both husband and wife were earners than there were White husband-wife families.

Standard error of a ratio. Certain mean values for persons in families shown in the tables of this report were calculated as the ratio of two numbers. For example, the mean number of persons per family is calculated as

$$\frac{x}{v} = \frac{\text{total number of persons in families}}{\text{total number of families}}$$

Standard errors for these means may be approximated as shown below. There are two cases to consider. In either case, the denominator y represents a count of families of a certain class, and the numerator x represents a count of persons with the characteristic under consideration who are members of these families.

Case 1: There is at least one person having the characteristics in every family of the class: as for example, the mean number of persons per family or the mean number of persons per family with a male head. For ratios of this kind, the standard error is approximated by the following formula:

$$\sigma_{\left(\frac{x}{y}\right)} = \sqrt{\left(\frac{x}{y}\right)^2 \left[\left(\frac{\sigma}{y}\right)^2 + \left(\frac{\sigma}{x}\right)^2 - 2\rho\left(\frac{\sigma}{x}\right)\left(\frac{\sigma}{y}\right)\right]}$$
(6)

The standard error of the estimated number of families, $\sigma_{\rm Y}$, and the standard error of the estimated number of persons with the characteristic in those families, $\sigma_{\rm X}$, may be calculated by the methods described above. In formula (6), ρ represents the correlation coefficient between the numerator and the denominator of the estimate. In the above examples, and for other ratios of this kind, use 0.7 as an estimate of ρ .

Case 2: The number of persons having the characteristic in a given family may be 0, 1, 2, 3 or more: for example, the mean number of persons under 18 years of age. For ratios of this kind the standard error is approximated by formula (6), but ρ is assumed to be zero. If ρ is actually positive, then this procedure will provide an overestimate of the standard error of the ratio.

Standard error of a median. Estimated standard errors are provided for medians discussed in the text of this report and

do not need to be calculated by the user. These standard errors appear in appendix tables A-2 through A-10 and A-25 and A-26. It was impossible to publish all income distributions for all the medians because of the lack of space. Income distributions, however, can be obtained upon request. Some users may wish to calculate standard errors for those distributions provided. The following section is provided to enable the user to calculate standard errors for estimated medians

The sampling variability of an estimated median depends upon the form of the distribution as well as the size of its base. An approximate method for measuring the reliability of a median is to determine an interval about the estimated median, such that there is a stated degree of confidence that the median based on a complete census lies within the interval. The following procedure may be used to estimate the 68-percent confidence limits of a median based on sample data.

- 1. Determine, using the standard error tables and factors or formula (4), the standard error of the estimate of 50 percent from the distribution:
- 2. Add to and subtract from 50 percent the standard error determined in step (1);
- 3. Using the distribution of the characteristic, calculate the confidence interval corresponding to the two points established in step (2).

A 95-percent confidence interval may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error determined in step (1).

Illustration of the computation of a confidence interval for a median. Table 133 of this report shows the median family income for Blacks in the United States in 1977 was estimated to be \$9,563. Table 133 also indicates the base of the distribution from which this median was determined is 5,806,000 families.

- 1. Using formula (4) the standard errors of 50 percent on a base of 5,806,000 is about 0.6 percent.
- 2. To obtain a 95-percent confidence interval on an estimated median, add to and subtract from 50 percent twice the standard error found in step (1). This yields percent limits of 48.8 and 51.2.
- 3. From table 133, 37 percent of the Black families had incomes less than \$7,000 and 15 percent had income between \$7,000 and \$9,999. By linear interpolation, the lower limit on the estimate is found to be about

$$\$6,999 + (\$3,000) \quad (\frac{48.8 - 37}{15}) = \$9,359$$

Similarly, the upper limit may be found by linear interpolation to be about

$$\$6,999 + (\$3,000) \left(\frac{51.2 - 37}{15}\right) = \$9,839$$

Thus, the 95-percent confidence interval on the estimated median is from \$9,359 to \$9,839.

Table C-1. Standard Errors of Estimated Numbers

Total or White Population-CPS Estimates

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
25	7 10 14 23 32 45	2,500	71 100 138 204 251

NOTE: For a particular characteristic, see table C-5 for the appropriate factor to apply to the above standard errors.

 1 For estimates larger than 50,000,000, multiply the estimate by 0.005 to get the standard error.

Table C-2. Standard Errors of Estimated Numbers

Black and Other Races Population-CPS Estimates

(68 chances out of 100. Numbers in thousands)

Size of estimate	Standard error	Size of estimate	Standard error
25	8	1,000	51
50	12	2,500	76
100	17	5,000	96
250	26	10,0001	97
500	37		

 ${f NOTE}:$ For a particular characteristic, see table C-5 for the factor to apply to the above standard errors.

 1 For estimates larger than 10,000,000, multiply the estimate by 0.010 to get the standard error.

Table C-3. Standard Errors of Estimated Percentages

Total or White Population-CPS Estimates

(68 chances out of 100)

Base of estimated percentages	Estimated percentage								
(thousands)	2 or 98	5 or 95	10 or 90	25 or 75	50
